# Mobile Device Tool Specification

Version 1.0

35

37 **Abstract**

38 As mobile devices proliferate, incorporating a host of integrated features and capabilities, their use  
39 can be seen everywhere in our world today. Mobile communication devices contain a wealth of  
40 sensitive and non-sensitive information. In the investigative community their use is not restricted to  
41 data recovery alone as in criminal cases, but also civil disputes and proceedings, and their aggregate  
42 use in research and criminal incident recreation continues to increase. Due to the exploding rate of  
43 growth in the production of new mobile devices appearing on the market each year is reason alone  
44 to pay attention to test measurement means and methods. The methods a tool uses to capture,  
45 process, and report data must incorporate a broad range of extensive capabilities to meet the  
46 demand as a robust data acquisition tool. In general, a forensic examination conducted on a mobile  
47 device is only a small subset of the larger field of digital forensics. Consequentially, tools  
48 possessing an exhaustive array of capabilities to acquire data from these portable mobile devices are  
49 relatively few in number.

50  
51 This specification defines requirements for mobile device applications capable of acquiring data  
52 from smart phones, feature phones, tablets, Universal Integrated Circuit Cards (UICCs), and test  
53 methods used to determine whether a specific tool meets the requirements for producing measurable  
54 results. Test requirements are statements used to derive test cases that define expectations of a tool  
55 or application. Test cases describe the combination of test parameters required to test each assertion.  
56 Test assertions are described as general statements or conditions that can be checked after a test is  
57 executed. Each assertion appears in one or more test cases consisting of a test protocol and the  
58 expected test results. The test protocol specifies detailed procedures for setting up the test,  
59 executing the test, and measuring the test results. The associated assertions and test cases are  
60 defined in the test plan document entitled: [Mobile Device Tool Test Assertions and Test Plan](#).

61  
62 Comments and feedback are welcome; revisions of this document are available for download at:

93 **1. Introduction**

94 The need to ensure the reliability of mobile device forensic tools intensifies, as the embedded  
95 intelligence and ever-increasing storage capabilities of mobile devices expand. The goal of the  
96 Computer Forensic Tool Testing (CFTT) project at the National Institute of Standards and  
97 Technology (NIST) is to establish a methodology for testing computer forensic software tools. This  
98 is accomplished by the development of both specific and common rules that govern tool  
99 specifications. We adhere to a disciplined testing procedure, established test criteria, test sets, and  
100 test hardware requirements, that result in providing necessary feedback information to toolmakers  
101 so they can improve their tool’s effectiveness; end users benefit in that they gain vital information  
102 making them more informed about choices for acquiring and using computer forensic tools, and  
103 lastly, we impart knowledge to interested parties by increasing their understanding of a specific  
104 tool’s capability. Our approach for testing computer forensic tools is based on established well-  
105 recognized international methodologies for conformance testing and quality testing. For more  
106 information on mobile device forensic methodology please visit us at: [www.cfft.nist.gov](http://www.cfft.nist.gov).

107  
108 The Computer Forensic Tool Testing (CFTT) program is a joint project of the National Institute of  
109 Justice (NIJ), the research and development organization of the U.S. Department of Justice, and the  
110 National Institute of Standards and Technology’s (NIST’s) Law Enforcement Standards Office  
111 (OLES) and Information Technology Laboratory (ITL). CFTT is supported by other organizations,  
112 including the Federal Bureau of Investigation, the U.S. Department of Defense Cyber Crime Center,  
113 U.S. Internal Revenue Service Criminal Investigation Division Electronic Crimes Program, U.S.  
114 Department of Homeland Security’s Bureau of Immigration and Customs Enforcement, U.S.  
115 Customs and Border Protection, and the U.S. Secret Service. The objective of the CFTT program is  
116 to provide measurable assurance to practitioners, researchers, and other applicable users that the  
117 tools used in computer forensics investigations provide accurate results. Accomplishing this  
118 requires the development of specifications and test methods for computer forensics tools and  
119 subsequent testing of specific tools against those specifications.

120  
121 The central requirement for a sound forensic examination of digital evidence is that the original  
122 evidence must not be modified (i.e., the examination or capture of digital data from a mobile device  
123 and associated media must be performed without altering the device or media content). In the event  
124 that data acquisition is not possible using current technology to access information without  
125 configuration changes to the device (e.g., loading a driver), the procedure must be documented.

126  
127 **2. Purpose**

128 This specification defines requirements for mobile device forensic tools used in digital forensics  
129 capable of acquiring internal memory from smart phones, feature phones, tablets and associated  
130 media i.e., Universal Integrated Circuit Cards (UICCs).

131  
132 The mobile device tool requirements are used to derive test assertions. The test assertions are  
133 described as general statements of conditions that can be checked after a test is executed. Each  
134 assertion generates one or more test cases consisting of a test protocol and the expected test results.  
135 The test protocol specifies detailed procedures for setting up the test, executing the test, and  
136 measuring the test results.

137 **3. Scope**

138 The scope of this specification is limited to software tools capable of acquiring the internal memory  
139 of smart phones, feature phones, tablets and UICCs. The mobile device tool specification is general  
140 and capable of being adapted to other types of mobile device forensic software.  
141

142 **4. Definitions**

143 This glossary was added to provide context in the absence of definitions recognized by the  
144 computer forensics community.

145 **Associated data:** Multi-media data (i.e., graphic, audio, video) that are attached and delivered via a  
146 multi-messaging service (MMS) message.

147 **Acquisition File:** A snapshot of data contained within the internal memory of a target mobile  
148 device (e.g., feature phone, smart phone, tablet) or associated media i.e., UICC.

149 **Case File:** A file generated by a forensic tool that contains the data acquired from a mobile device  
150 or associated media and case-related information (e.g., case number, property/evidence number,  
151 agency, examiner name, contact information, etc.) provided by the examiner.

152 **CDMA:** Code Division Multiple Access describes a communication channel access method that  
153 employs spread-spectrum technology and a special coding scheme.

154 **CHV:** Card Holder Verification is a personal identification number (PIN) that provides access to a  
155 Universal Integrated Circuit Card (UICC).

156 **CDMA Subscriber Identity Module (CSIM)** – CSIM is an application to support CDMA2000  
157 phones that runs on a UICC, with a file structure derived from the R-UIM card.

158 **Data Objects:** Files or directories stored in the internal memory of the device or UICC such as  
159 address book entries, Personal Information Management data, call logs, text messages, stand-  
160 alone files (e.g., graphic files, audio, video).

161 **Electronic Serial Number (ESN):** ESNs were issued until 2005, which uniquely identified CDMA  
162 phones. An ESN number consist of a 32-bit alphanumeric string that allowed a maximum of 4  
163 billion unique numbers.

164 **Enhanced Message Service (EMS):** Text messages over 160 characters or messages that contain  
165 either Unicode characters or a 16x16, 32x32 black and white image.

166 **Feature phone:** A device whose major function is primarily handling incoming/outgoing phone  
167 calls over a wireless network (e.g., GSM, CDMA) with limited task management applications.

168 **Flash memory:** Non-volatile memory that retains data after the power is removed.

169 **Global Positioning System (GPS):** A navigational system involving satellites and computers that  
170 can determine the latitude and longitude of a receiver.

171 **Global System for Mobile Communications (GSM):** An open, digital cellular technology for  
172 transmitting mobile voice and data services.

173 **Hard reset:** The process used to reboot the smart phone returning the device back to the initial  
174 factory install state, potentially erasing all user data (e.g., contacts, tasks, calendar entries).

## DRAFT FOR COMMENTS

- 175 **Hashing:** The process of using a mathematical algorithm against data to produce a numeric value  
176 that is representative of that data.
- 177 **Human-readable format:** Acquired data shown in a human language rather than binary data.
- 178 **IM:** Internal Memory. Volatile and non-volatile storage space for user data.
- 179 **Logical acquisition:** Implies a bit-by-bit copy of logical storage objects (e.g., Address book,  
180 Personal Information Management data, Call logs, text messages, stand-alone data files) that  
181 reside on a logical store (e.g., a file system partition).
- 182 **Mobile Equipment Identity (MEID):** An ID number that is globally unique for CDMA mobile  
183 phones that identifies the device to the network and can be used to flag lost or stolen devices.
- 184 **Mobile Subscriber International Subscriber Directory Number (MSISDN):** The MSISDN is  
185 the telephone number assigned to the subscriber for receiving calls on the phone.
- 186 **Multimedia Messaging Service (MMS) message:** Provides users with the ability to send text  
187 messages containing multimedia objects (i.e., graphic, audio, video).
- 188 **Personal Information Management (PIM) data:** Data that contains personal information such as:  
189 calendar entries, to-do lists, memos, reminders, etc.
- 190 **Physical acquisition:** A bit-by-bit acquire of the mobile device internal memory.
- 191 **PIN:** A Personal Identification Number that is 4 to 8 digits in length used to secure mobile devices  
192 from unauthorized access.
- 193 **Preview pane:** Section of the Graphical User Interface (GUI) that provides a snapshot of the  
194 acquired data.
- 195 **PUK:** A Personal Unblocking Key used to regain access to a locked mobile device whose PIN  
196 attempts have been exhausted.
- 197 **Recoverable data objects:** Logically deleted data objects that have not been overwritten.
- 198 **Short Message Service (SMS):** A service used for sending text messages (up to 160 characters) to  
199 mobile devices.
- 200 **Smart phone:** A full-featured mobile phone that provides users with personal computer like  
201 functionality by incorporating PIM applications, enhanced Internet connectivity and email  
202 operating over an Operating System supported by accelerated processing and larger storage  
203 capacity compared with present cellular phones.
- 204 **MDT:** Mobile Device Tool. A tool capable of acquiring the internal memory from a smart phone,  
205 feature phone, tablet or UICC.
- 206 **Removable User Identity Module (R-UIM) –** A card developed for cdmaOne/CDMA2000  
207 handsets that extends the GSM SIM card to CDMA phones and networks.
- 208 **Stand-alone data:** Data (e.g., graphic, audio, video) that is not associated with or has not been  
209 transferred to the device via email or MMS message.
- 210 **Subscriber Identity Module (SIM):** A smart card that contains essential subscriber information  
211 and additional data providing network connectivity to mobile equipment operating over a GSM  
212 network.

213 **Supported Data Objects:** Data objects (e.g., subscriber information, PIM data, text messages,  
214 stand-alone data, MMS messages and associated data) that the cellular forensic tool has the  
215 ability to acquire according to the cellular forensic tool documentation.

216 **Tablet:** A Tablet PC is a laptop PC equipped with a stylus or a touchscreen. This form factor is  
217 intended to offer a more mobile PC.

218 **Universal Integrated Circuit Card:** An integrated circuit card that securely stores the international  
219 mobile subscriber identity (IMSI) and the related cryptographic key used to identify and  
220 authenticate subscribers on mobile devices. A UICC may be referred to as a: SIM, USIM, R-UIM  
221 or CSIM, and is used interchangeably with those terms.

222 **UMTS Subscriber Identity Module (USIM)** – A module similar to the SIM in GSM/GPRS  
223 networks, but with additional capabilities suited to 3G networks.

224 **User data:** Data populated onto the device using mobile device default applications.  
225

## 226 **5. Background**

### 228 **5.1 Mobile Device Characteristics – Internal Memory**

229 Mobile devices typically contain one or two different types of non-volatile flash memory. These  
230 types are NAND and NOR. NOR flash has slower read/write times and is nearly immune to  
231 corruption and bad blocks while allowing random access to any memory location. NAND flash  
232 offers higher memory storage capacities, is less stable and only allows sequential access.  
233

234 Memory configurations among mobile devices have evolved over time. Feature phones were  
235 among the first types of devices that contained NOR flash and RAM memory. System and user  
236 data are stored in NOR and copied to RAM upon booting for faster code execution and access. This  
237 is known as the first generation of mobile memory configurations.

238 As smartphones were introduced, memory configurations evolved, adding NAND flash memory.  
239

240 This arrangement of NOR, NAND and RAM memory is referred to as the second generation. This  
241 generation of memory configurations stores system files in NOR flash and user files in NAND;  
242 RAM is used for code execution. The latest smartphones contain only NAND and RAM memory  
243 (i.e., third generation), due to higher transaction speed, greater storage density and lower cost.  
244

245 Although data present on mobile devices may be stored in a proprietary format, forensic tools  
246 tailored for mobile device acquisition should minimally be able to perform a logical acquisition for  
247 supported devices and provide a report of the data present in the internal memory. Tools that  
248 possess a low-level understanding of the proprietary data format for a specific device may provide  
249 examiners with the ability to perform a physical acquisition and generate reports in a meaningful  
250 (i.e., human-readable) format.  
251

252 **5.2 UICC Characteristics**

253 Due to the GSM 11.11<sup>1</sup> standard, mobile device forensic tools designed to extract data from a UICC  
254 either internally or with an external Personal Computer/Smart Card (PC/SC) reader, should be able  
255 to properly acquire, decode, and present data in a human-readable format. An abundance of  
256 information is stored on UICCs such as Abbreviated Dialing Numbers (ADNs), Last Numbers  
257 Dialed (LND), SMS messages, subscriber information (e.g., IMSI), and location information (i.e.,  
258 Location Information [LOCI], General Packet Radio Service Location [GPRSLOCI]).  
259

260 **5.3 Digital Evidence**

261 The amount and richness of data contained on mobile devices vary based upon the manufacturer  
262 and OS. Pre-loaded applications and the ability to install customized applications provide users with  
263 endless solutions. However, there is a core set of data that computer forensic tools can recover that  
264 remains somewhat consistent across the majority of mobile devices. Tools should have the ability to  
265 recover the following data objects stored in the device's internal memory and associated media:

- 266 • International Mobile Equipment Identifier (IMEI) – GSM device memory
- 267 • Mobile Equipment Identifier (MEID) / Electronic Serial Number (ESN) – CDMA device  
268 memory
- 269 • Service Provider Name (SPN) – UICC memory
- 270 • Integrated Circuit Card Identifier (ICCID) – UICC memory
- 271 • International Mobile Subscriber Identity (IMSI) – UICC memory
- 272 • Mobile Subscriber International ISDN Number (MSISDN) – UICC memory
- 273 • Personal Information Management (PIM) data - (e.g., Address book, Calendar entries, to-do  
274 list, Tasks, Memos) – device memory
- 275 • Abbreviated Dialing Numbers (ADNs) – UICC memory
- 276 • Call logs – Incoming and outgoing calls – device memory
- 277 • Last Numbers Dialed (LND) – UICC memory
- 278 • Text messages (SMS, EMS) – device memory, UICC memory
- 279 • Multi-media Messages (MMS)/email - and associated data (i.e., audio, graphics, video) –  
280 device memory
- 281 • Application data - (e.g., Word documents, spreadsheet data, presentation data, etc.) – device  
282 memory
- 283 • File storage - Stand-alone files such as audio, graphic and video – device memory
- 284 • Internet data - (e.g., bookmarks, visited sites, cached URLs) – device memory
- 285 • Social media related data - (e.g., facebook, twitter, LinkedIn, Instagram) – device memory
- 286 • GPS related data - Longitude and latitude coordinates – device memory  
287

288 **5.4 Test Methodology**

289 To provide repeatable test results, the following test methodology is strictly followed. Each forensic  
290 application under evaluation is installed on a dedicated (i.e., no other forensic applications are  
291 installed) host computer operating with the required platform as specified by the application. The  
292 internal memory of the source device and UICC is populated with a known dataset. Source devices

---

<sup>1</sup> <http://www.tfn.net/techno/smartcards/gsm11-11.pdf>

293 are stored in a protected state subsequent to initial data population, thus eliminating the possibility  
294 of data modification due to network connectivity.

295  
296 The following data objects (if supported) are used in populating the internal memory of the mobile  
297 devices: address book, PIM data, application data, Internet data, call logs, text messages (SMS,  
298 EMS), MMS messages/email with attachments (i.e., audio, graphic, video), stand-alone data files  
299 (i.e., audio, graphic, video), social media related data and GPS coordinates.

300  
301 The following data objects are used for populating the UICC: Abbreviated Dialing Numbers  
302 (ADNs), Last Numbers Dialed (LND), Short Messaging Service (SMS) messages – (marked as  
303 Read, Unread and Deleted) and EMS messages.

## 304 **6. Requirements**

305 The mobile device tool requirements are in two sections: 6.1 and 6.2. Section 6.1 lists requirements  
306 i.e., Mobile Device Tool-Core Requirement-01, MDT-CR-01 through MDT-CR-04 that all  
307 acquisition tools shall meet. Section 6.2 lists requirements i.e., Mobile Device Tool-Requirement  
308 Optional-01, MDT-RO-01 through MDT-RO-11 that the tool shall meet on the condition that  
309 specified features or options are offered by the tool.

310

### 311 **6.1 Requirements for Core Features**

312 All mobile device forensic tools capable of acquiring the internal memory of a mobile device shall  
313 meet the following core requirements.

314

315 **MDT-CR-01** A mobile device forensic tool shall have the ability to recognize supported devices  
316 via the vendor-supported interfaces (e.g., cable, Bluetooth, Infrared).

317 **MDT-CR-02** A mobile device forensic tool shall have the ability to notify the user of connectivity  
318 errors between the device and application during acquisition.

319 **MDT-CR-03** A mobile device forensic tool shall have the ability to provide the user with either a  
320 preview pane or generated report view of data acquired.

321 **MDT-CR-04** A mobile device forensic tool shall have the ability to logically acquire all application  
322 supported data objects present in internal memory without modifying the data objects present on  
323 the device.

324

### 325 **6.2 Requirements for Optional Features**

326 The following mobile device tool requirements define optional tool features. If a tool provides the  
327 capability defined, the tool is tested for conformance to these requirements. If the tool does not  
328 provide the capability defined, the requirement does not apply.

329

330 The following optional features are identified:

- 331 • UICC acquisition
- 332 • Data Integrity
- 333 • Password-protected UICCs
- 334 • PIN/PUK input
- 335 • Physical acquisition

- 336 • Non-ASCII character support
- 337 • Hashing
- 338 • GPS Coordinates

### 339 **6.2.1 UICC Acquisition**

340 **MDT-RO-01** A mobile device forensic tool shall have the ability to recognize supported UICCs via  
341 the vendor supported interface (e.g., PC/SC reader, proprietary reader, internal).

342 **MDT-RO-02** A mobile device forensic tool shall have the ability to notify the user of connectivity  
343 errors between the UICC reader and application during acquisition.

344 **MDT-RO-03** A mobile device forensic tool shall have the ability to acquire all application-  
345 supported data objects present in the UICC memory.

### 346 **6.2.2 Data Integrity**

347 **MDT-RO-04** A mobile device forensic tool shall have the ability to protect previously acquired  
348 data objects within a saved case file from modification.

### 349 **6.2.3 Password Protected UICCs**

350 **MDT-RO-05** A mobile device forensic tool shall have the ability to provide the user with the  
351 ability to unlock a password protected UICC before acquisition.

### 352 **6.2.4 PIN Attempts**

353 **MDT-RO-06** A mobile device forensic tool shall have the ability to present the remaining number  
354 of CHV1/CHV2 PIN unlock attempts.

### 355 **6.2.5 PUK Attempts**

356 **MDT-RO-07** A mobile device forensic tool shall have the ability to present the remaining number  
357 of PUK unlock attempts.

### 358 **6.2.6 Physical Acquisition**

359 **MDT-RO-08** A mobile device forensic tool shall have the ability to perform a physical acquisition  
360 of the device's internal memory for supported devices.

### 361 **6.2.7 Non-ASCII Characters**

362 **MDT-RO-09** A mobile device forensic tool shall have the ability to present data objects containing  
363 non-ASCII characters acquired from the internal memory of the mobile device or UICC. Non-  
364 ASCII characters shall be printed in their native representation.

### 365 **6.2.8 Stand-alone Acquisition**

366 **SPT-RO-10** A mobile device forensic tool shall have the ability to acquire internal memory data  
367 without modifying data present on the UICC.

368 **6.2.9 Hashing**

369 **MDT-RO-11** A mobile device forensic tool shall have the ability to compute a hash for individual  
370 data objects.

371 **6.2.10 GPS Coordinates**

372 **MDT-RO-12** A mobile device forensic tool shall have the ability to acquire GPS related data  
373 present in the internal memory.

374
