

## Biometric Identity Management System

In February 2015, UNHCR completed development of its new biometric identity management system (BIMS), building on the successful use of biometrics across a number of UNHCR operations globally. When fully rolled out, **BIMS will support all standard registration activities and help to better register and protect people, verify their identity and target assistance for the forcibly displaced in operations around the world.**

## Agenda

**INTERNATIONAL BIOMETRIC  
PERFORMANCE CONFERENCE**  
Evaluation and Performance of Biometric Technologies

**May 3 – 5, 2016: Gaithersburg, MD**

- 
- Project Overview
  - Solution Overview
  - Operations
  - High-level Architecture
  - Metrics
  - What's Next

# UNHCR

## Overview

**INTERNATIONAL BIOMETRIC  
PERFORMANCE CONFERENCE**  
Evaluation and Performance of Biometric Technologies

**May 3 – 5, 2016: Gaithersburg, MD**

### Project goals:

- Introduction of a global biometric enrolment and verification solution for the purpose of:
  - Equitable distribution of benefits (ration)
  - Move away from paper-based system where identity documents can be lost
  - Reduce fraud
- Usage must be possible in urban centers as well as in field environments
- Scope: capture, enrolment and verification of the biometric data of the entire refugee population across disparate locations

### Key requirements:

- Modular system design
- Rugged, Fast, accurate, effective, non-invasive, intuitive
- Scalable and extensible
- Non-proprietary and vendor agnostic

# UNHCR Overview

May 3 – 5, 2016: Gaithersburg, MD

## Supported functions:

- Enrollment
- Identification and Verification
- Deduplication and resolution of adjudication cases
- Administration portal (User Administration, Roles and Permissions, Synchronization configuration)
- Reporting
- System Monitoring
- Simple License Management

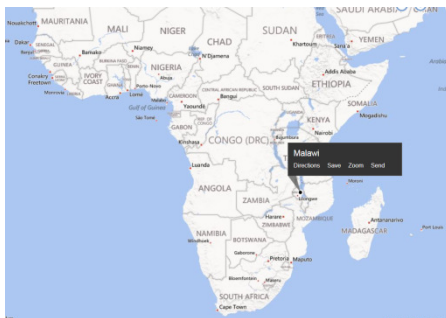

## Project scope:

- Customization, Configuration, Integration
- Client training (train-the-trainer)
- Customized training materials and user documentation
- Client administrator training and documentation
- UAT environment setup
- Transition to Support and Maintenance

## Integration and Customization timeline:

- 5 months for customization, User Acceptance Test and Deployment
- 1 month for the field Site Acceptance Test

**Pilot**

## BIMS - Architecture

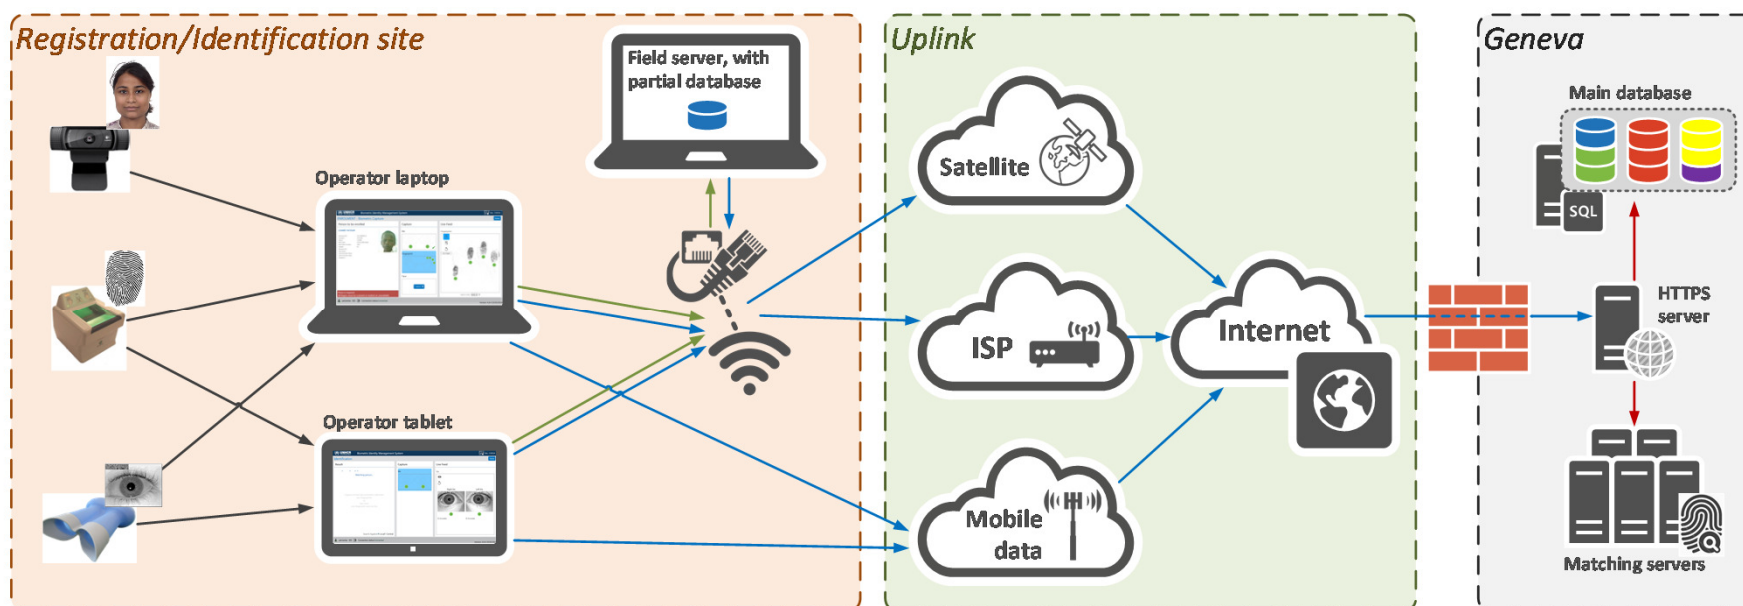

May 3 – 5, 2016: Gaithersburg, MD

### BIMS Capture Devices

- 10 fingerprint images
- 2 iris images
- 1 facial image

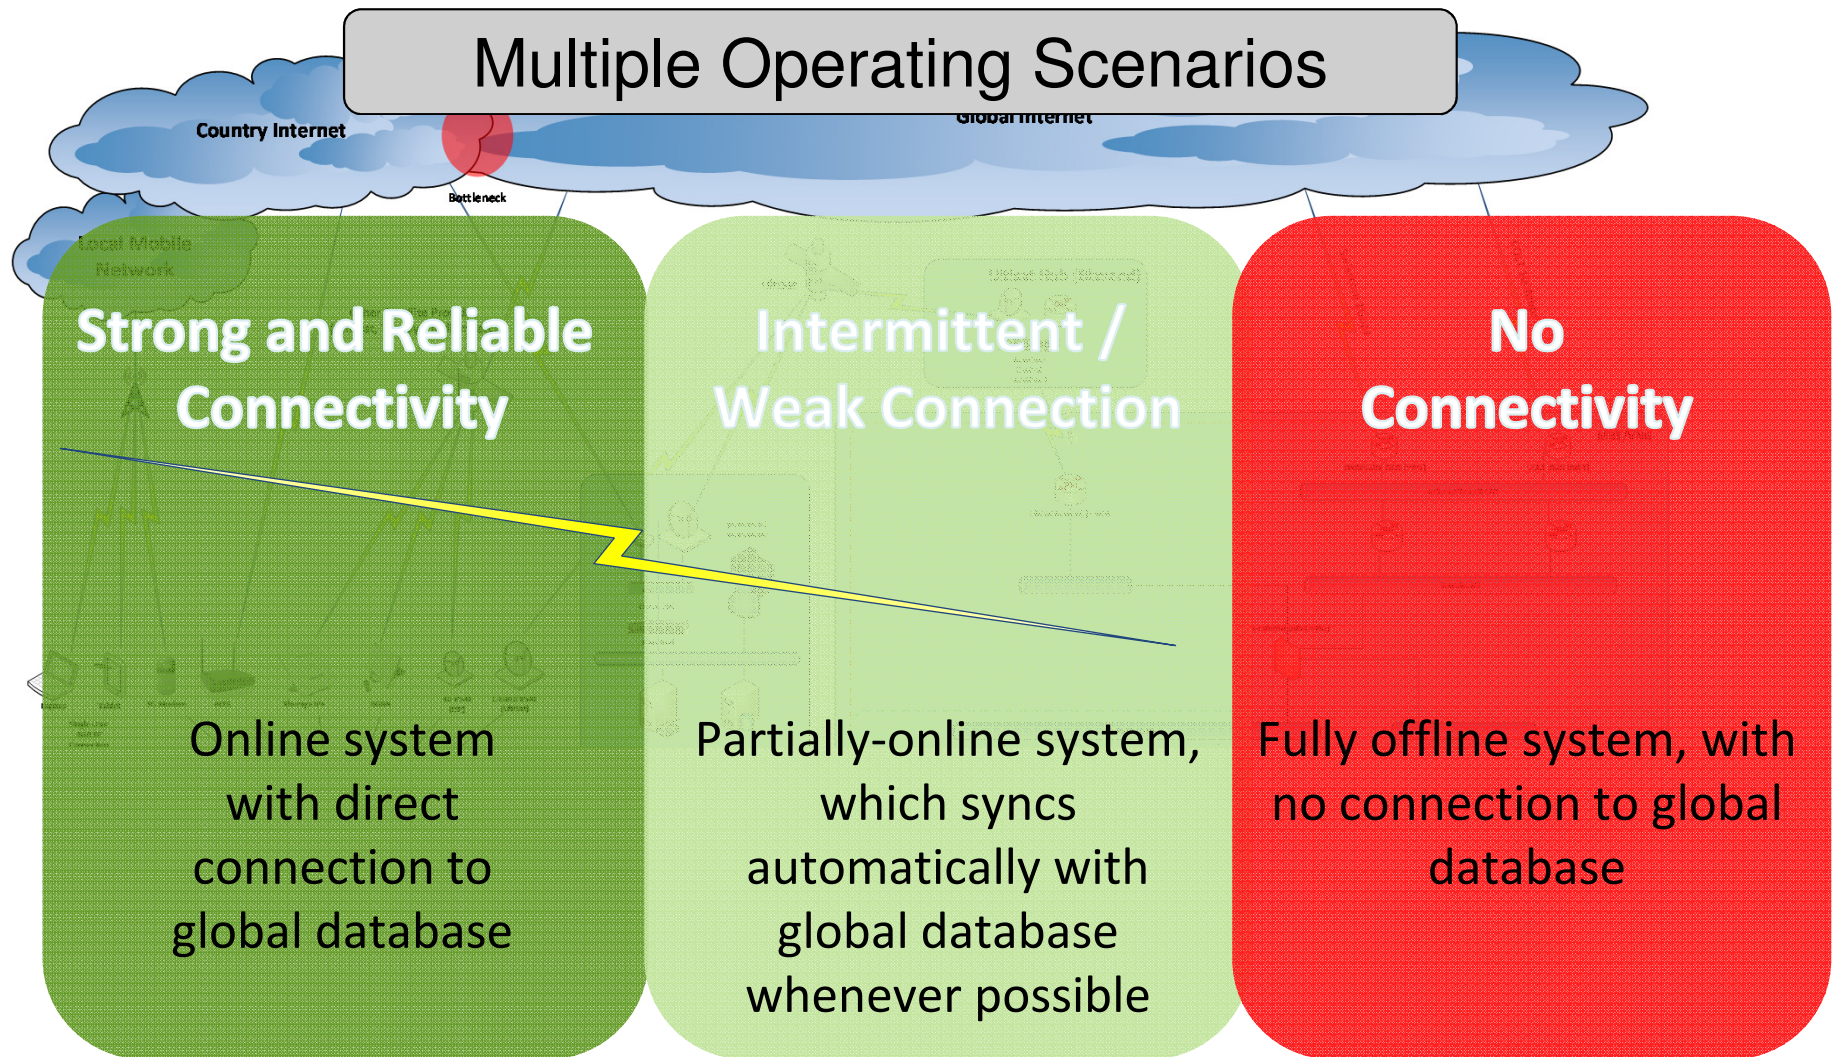

### BIMS Local Server

- Creates biometric templates
- Matches with local database to ensure no duplicates
- Queues enrolment for submission to Central System

### BIMS Central Server

- Accepts enrolment package from BIMS Local Server
- De-duplicates enrolment with global gallery of biometric records
- Manages synchronization between Local Servers (Local-Central-Local)
- Manages adjudication cases (suspected duplicates) and sends cases down to relevant Local BIMS Server

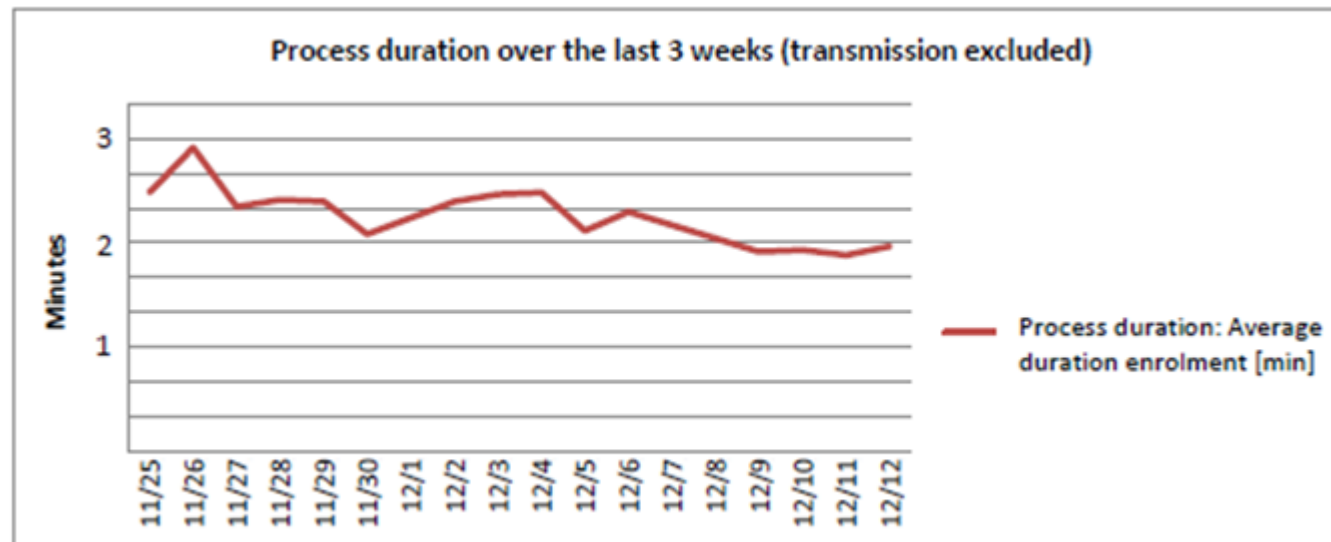

- 16 enrolment stations
- 4 verification stations
- Target average of 1,000 per day
- 16,849 refugees enrolled
- 314 adjudication cases (91% of which were in the 0-3 age range)
- 4 week exercise
- 140 staff

The exercise has proven that iris was the easiest biometric to capture with a recapture attempt only once every 7 enrollees on average and 1 in 5 enrollees had to recapture some fingerprints mostly recapturing a complete slap (4 fingers). Due to the challenging lighting and background, face has proven to be the biometric with the highest recapture rate with an average 2 captures per enrollee to acquire a good face quality image.

Operators stated they were comfortable with the application after only 30 – 60 minutes of operations – after a half-day training session prior to Go-Live.

The average enrolment process lasted 2 minutes 11 seconds, and **the average time was reduced to under 2 minutes towards the end of the pilot, as the operators became increasingly proficient with the system.**

---

Of the whole population, 81% could capture good quality fingerprints, 12% low quality and 7% couldn't capture.

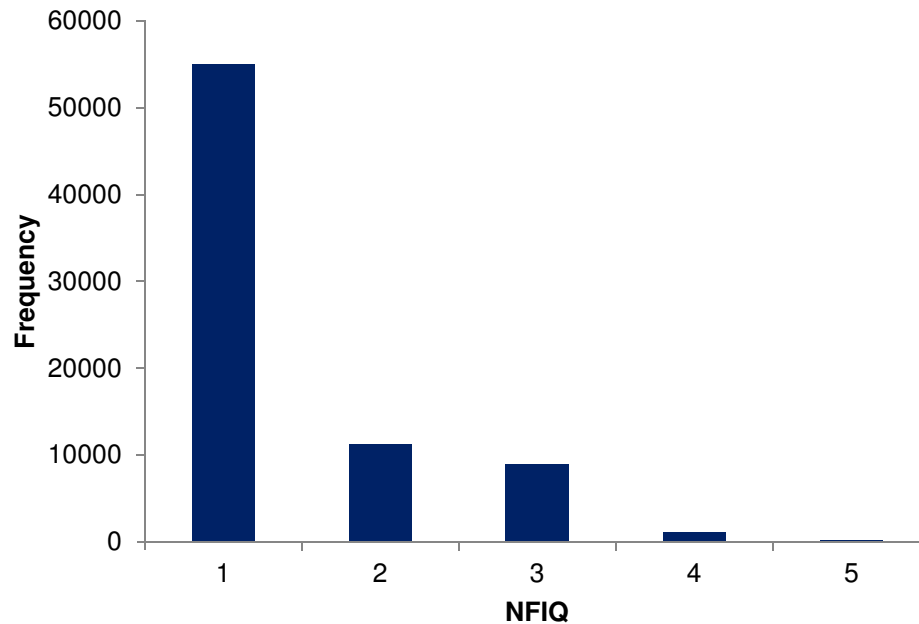

### Ages 4+

- 87% over four 'good' fingerprints
- 12% low quality fingerprints
- 1% no capture

### Ages 0-3

- 2% over four 'good' fingerprints
- 2% low quality fingerprints
- 96% no capture

**Fingerprint quality:** Samples with a NIST Fingerprint Image Quality (NFIQ) score of 1, 2, or 3 are considered 'good' quality.

Taking a sample of 76,000 enrolled identities in production, 98% of the fingerprints were NFIQ 3 or better

Rick Lazarick analyzed the poor quality samples and highlighted that **index fingers** and **thumbs** proved to be the largest percentage of the poor quality samples:

Finger	NFIQ-5	NFIQ-4	5 in %	4 in %
1	14	279	8.4%	24.8%
2	40	91	24.0%	8.1%
3	5	35	3.0%	3.1%
4	8	77	4.8%	6.8%
5	14	47	8.4%	4.2%
6	15	344	9.0%	30.6%
7	32	72	19.2%	6.4%
8	7	63	4.2%	5.6%
9	13	86	7.8%	7.6%
10	19	31	11.4%	2.8%

Index fingers (2,7) have much larger NFIQ=5 proportions  
Thumbs (1,6) have much larger NFIQ=4 proportions.

Of the whole population, 85% could capture good quality irises, 8% could capture one good quality iris, 1% low quality and 6% couldn't capture at all.

### Ages 4+

- 98% at least one 'good' iris
- 1% low quality irises
- 1% no capture

### Ages 0-3

- 14% at least one 'good' irises
- 0.1% low quality irises
- 85.9% no capture

**Iris quality:** Following ISO/IEC 19794-6:2011: focus, contrast, occlusion, Signal to Noise (SNR), saturation, and grey level are assessed to determine quality.

Of the whole population, 85% could capture good quality irises, 8% could capture one good quality iris, 1% low quality and 6% couldn't capture at all.

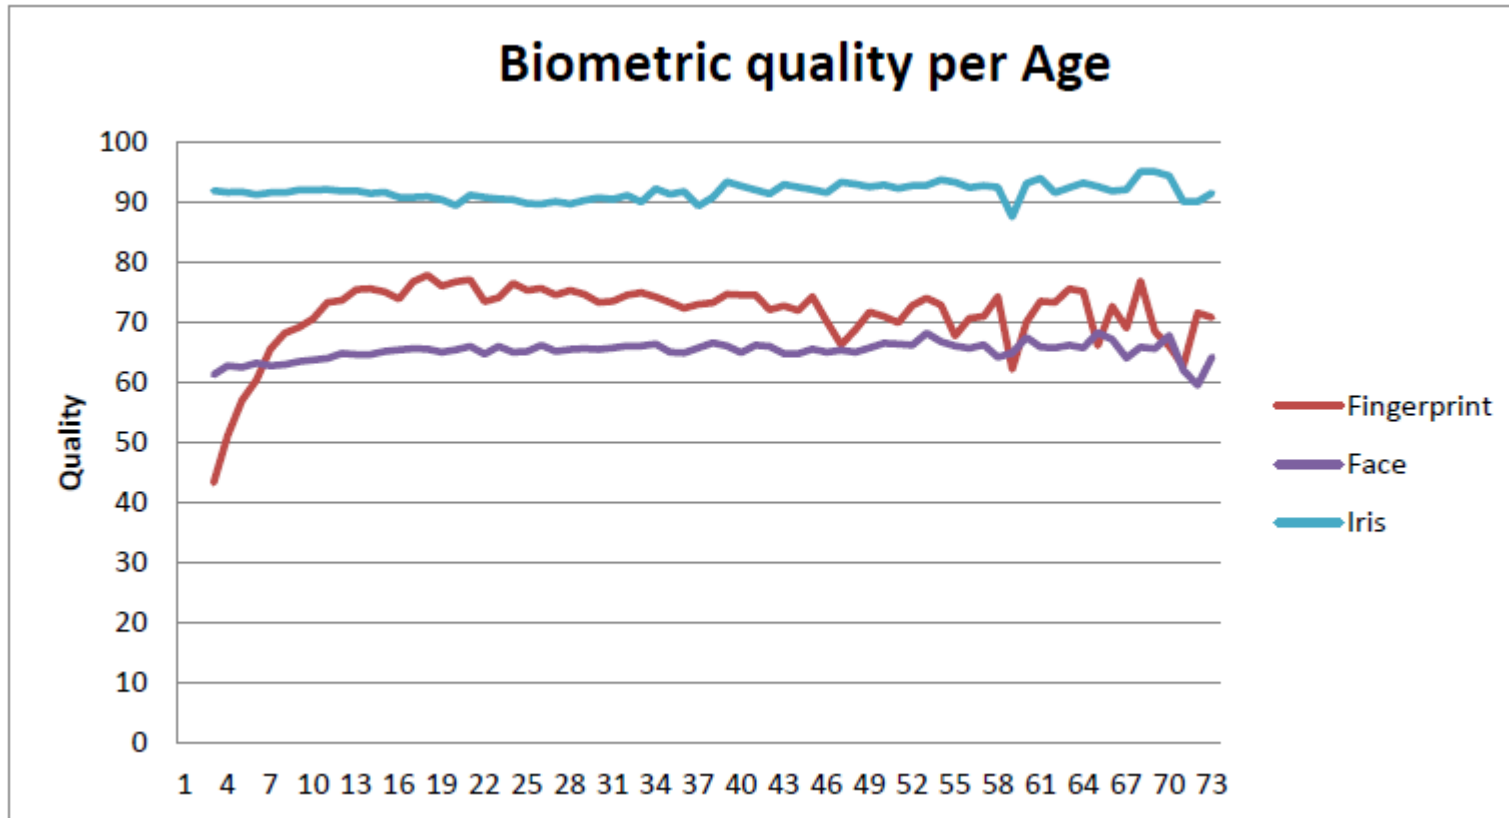

### Ages 4+

- 79% 'good' face
- 20% low quality face
- 1% no capture

### Ages 0-3

- 57% 'good' face
- 42% low quality face
- 1% no capture

**Face quality:** Following ISO/IEC 19794-5:2011: eye gaze, eyes openness, red eye, exposure, natural skin color, image, focus, hot spots, horizontal and vertical alignment, sharpness, image resolution, plain background, width-height head ratio are assessed to determine quality.
