

TACOMA PUBLIC UTILITIES
3628 South 35th Street
Tacoma, Washington 98409-3192

April 10, 2013

Diane Honeycutt
National Institute of Standards and Technology
100 Bureau Drive, Stop 8930
Gaithersburg, MD 20899

Dear Ms. Honeycutt:

Please accept these comments submitted by Tacoma Public Utilities (TPU) in response to NIST docket number 130208119-3119-01, "Developing a Framework to Improve Critical Infrastructure Cybersecurity." We regret our late response but hope you will find our feedback helpful as NIST develops a framework to reduce cyber-risks to critical infrastructure. As a member of the American Public Power Association (APPA) and the Large Public Power Council (LPPC), Tacoma Public Utilities supports the comments submitted by those entities.

As background, TPU is the municipally owned utility of the City of Tacoma. TPU provides electricity, drinking water, rail and telecommunications to tens of thousands of customers within the City of Tacoma and throughout incorporated and non-incorporated communities throughout Pierce and King Counties in Washington State.

As you know, Tacoma Public Utilities is required to comply with mandatory and enforceable federal electric reliability standards that are specifically designed to protect the electric grid from reliability risks, including physical and cyber-attacks. The North American Electric Reliability Corporation (NERC), designated by the Federal Energy Regulatory Commission (FERC) as the electric reliability organization under the Federal Power Act (FPA), enlisted teams of industry subject-matter experts and responded to FERC directives to create mandatory and enforceable Critical Infrastructure Protection standards ("CIP Standards") for the bulk electric system (BES).

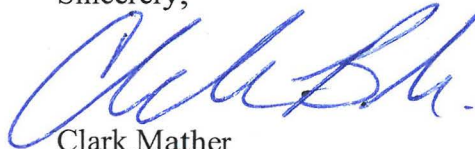

The electric power industry as a whole and Tacoma Public Utilities in particular has a long history of reliably serving our customers. The accountability we have to our citizen-customers provides us with constant motivation to maintain a reliable, low-cost system. Because each utility has unique operational designs and needs, we believe that industry expertise and public-private information sharing is critical to cybersecurity protection planning and implementation. We remain interested in working with the federal government and our regulators to create and actively participate in a robust system of information sharing between federal intelligence communities and our industry. Enhanced information sharing is a key component to strengthening the protection of the bulk electric system moving forward.

Letter from Tacoma Public Utilities
April 10, 2013
Page 2

Should you have any questions, please contact myself, Clark Mather, at 253-441-4159. We look forward to working with you as the process laid out in Executive Order 13636 moves ahead.

Sincerely,

Clark Mather
Senior Manager for External Affairs

Tacoma Public Utilities NIST Cybersecurity Framework RFI Comments

1 **Current Risk Management Practices**

2 NIST solicits information about how organizations assess risk; how cybersecurity factors
3 into that risk assessment; the current usage of existing cybersecurity frameworks,
4 standards, and guidelines; and other management practices related to cybersecurity. In
5 addition, NIST is interested in understanding whether particular frameworks, standards,
6 guidelines, and/or best practices are mandated by legal or regulatory requirements and
7 the challenges organizations perceive in meeting such requirements. This will assist in
8 NIST's goal of developing a Framework that includes and identifies common practices
9 across sectors.

10 **1. What do organizations see as the greatest challenges in improving** 11 **cybersecurity practices across critical infrastructure?**

12 TPU and our industry generally continues to place high on the list of challenges the
13 need for information sharing between the federal government, intelligence community
14 and the private sector, and the timely dissemination of actionable information on
15 emerging threats and vulnerabilities as well as responses. This information includes the
16 granting of additional, and in some cases higher-level, security clearances for electric
17 utility representatives.

18 Additionally, mapping of critical infrastructure points of reliance, and building
19 communication channels around those is also recommended. Appropriate controls on
20 information disclosure must also be implemented.

21 An example of an effective collaborative information exchange is the Public Regional
22 Information Security Event Management (PRISEM) system. This system is an online
23 early-warning system that aggregates and analyzes real-time cyber event information
24 across the Puget Sound metropolitan area - for federal, state and local government;
25 universities; and private sector partners. Member organizations include, Snohomish
26 Public Utilities District, Seattle City Light, Children's Hospital, Port of Seattle, Port of
27 Tacoma, and more.

28 Vendor management and oversight is another factor in cybersecurity risk management.
29 Cybersecurity must become an integral part of the development, manufacturing,
30 distribution and support systems of our vendors. Vendor requirements should address
31 secure product development, secure manufacturing, distribution, and continued support
32 for security patching throughout the product lifecycle. Incentives for vendors in the
33 Industrial Control Systems space to support a new framework could go a long way in
34 making this happen.

Tacoma Public Utilities NIST Cybersecurity Framework RFI Comments

35 Another concern is the historical industry focus on availability. This was done, at least in
36 part, by removing device complexity to reduce the risk of device failure. This has the
37 potential of leaving devices insecure due to lack of necessary support for basic security
38 controls such as complex passwords, access logging, and link encryption. The focus on
39 availability can leave historical devices exposed. Because of the critical nature of the
40 electricity subsector's service delivery, replacement of these assets must be done
41 systematically and over a period of years.

42 **2. What do organizations see as the greatest challenges in developing a cross-** 43 **sector standards-based Framework for critical infrastructure?**

44 While a one-size-fits-all approach may be desired, the reality is that each sector and
45 organization has its own specific set of risks, and therefore must provide its own set of
46 controls. Under a cross-sector approach, incorporating appropriate controls for these
47 disparate risks in a meaningful way may be the greatest challenge. Another challenge
48 will be regional and cross-sector information sharing.

49 General information security frameworks exist, such as, ISO27000, ITIL, COBIT v5,
50 Common Criteria and SANS 20 Critical Security Controls.

51 The implementation of any of these standards is up to the organization, and as such
52 varies greatly between like organizations. However, there are obvious similarities in
53 taxonomy between organizations that deliver based on the same standard (i.e.
54 ISO27001) which benefits those organizations by speaking the same security
55 "language."

56 Unfortunately, these frameworks or standards do not address the necessary regional
57 and cross-sector information sharing required to better address critical infrastructure
58 cybersecurity needs.

59 **3. Describe your organization's policies and procedures governing risk generally** 60 **and cybersecurity risk specifically. How does senior management communicate** 61 **and oversee these policies and procedures?**

62 Tacoma Power's Internal Compliance Program (ICP) is the governing document
63 applicable to all employees who perform functions that directly or indirectly affect any
64 portion of the BES. The ICP describes the steps undertaken by Tacoma Power to
65 implement its commitment to the reliable operation of the BES in compliance with all
66 federal laws and regulations and applicable North American Electric Reliability
67 Corporation (NERC) Reliability Standards as approved by FERC. This document
68 describes how Tacoma Power institutionalizes the compliance program and contains
69 references to the documented plans, policies, procedures, and other systematic

Tacoma Public Utilities NIST Cybersecurity Framework RFI Comments

70 preventive measures used for governance, management, and operations. The program
71 is managed by the Reliability & Compliance Manager with oversight and guidance
72 provided by the Reliability & Compliance Governance Committee (RCGC). The RCGC
73 includes the Tacoma Power Superintendent, the RCM, R&C Senior Supervisor, TPU
74 legal counsel, and the manager of each of Tacoma Power's business units. The
75 Tacoma Power Superintendent chairs the RCGC.

76 **4. Where do organizations locate their cybersecurity risk management** 77 **program/office?**

78 Tacoma Power's cybersecurity risk management program resides in a business unit,
79 managed by the CIP Senior Manager, which contains system administrators and
80 reliability & compliance (R&C) personnel. R&C assesses CIP compliance and risk,
81 based on likelihood and consequences, while system administrators implement and
82 perform processes to ensure compliance with NERC Reliability Standards for the
83 system.

84 **5. How do organizations define and assess risk generally and cybersecurity risk** 85 **specifically?**

86 For electric utilities, risk is generally defined as a function of the likelihood that the
87 delivery of electric power will be disrupted. Reflecting this basic concept, DOE's RMP
88 guideline – developed in conjunction with NIST, NERC and the electric subsector –
89 defines "Cybersecurity Risk" as

90 "[t]he risk to organizational operations (including mission, functions, image,
91 reputation), resources, and other organizations due to the potential for unauthorized
92 access, use, disclosure, disruption, modification, or destruction of information
93 and/or [information technology] and [industrial control systems]."¹

94

95 **6. To what extent is cybersecurity risk incorporated into organizations'** 96 **overarching enterprise risk management?**

97 Cybersecurity is fully incorporated into the organization throughout Tacoma Power.
98 Each system or facility is assessed prior to new equipment being introduced into the
99 current infrastructure. Hardware, software, and other changes to the system are tested
100 and/or assessed for all changes to Tacoma Power's CIP system. Routine vulnerability

¹ DOE RMP guideline at 66.

**Tacoma Public Utilities
NIST Cybersecurity Framework RFI Comments**

101 assessments are conducted at least annually to incorporate all devices in the CIP
102 system.

103 **7. What standards, guidelines, best practices, and tools are organizations using**
104 **to understand, measure, and manage risk at the management, operational, and**
105 **technical levels?**

106 Tacoma Power adheres to the NERC-CIP Standards:

- 107 CIP-001-2 – Sabotage Reporting
- 108 CIP-002-3 – Critical Cyber Asset Identification
- 109 CIP-003-3 – Security Management Controls
- 110 CIP-004-3 – Personnel & Training
- 111 CIP-005-3 – Electronic Security Perimeters
- 112 CIP-006-3 – Physical Security of Critical Cyber Assets
- 113 CIP-007-3 – Systems Security Management
- 114 CIP-008-3 – Incident Reporting and Response Planning
- 115 CIP-009-3 – Recovery Plans for Critical Cyber Assets

116
117 Additional resources utilized are:

- 118 • DOE Electricity Subsector Cybersecurity Risk Management Process (RMP)
119 guideline
- 120 • DOE ES-C2M2 (Electricity Subsector – Cybersecurity Capability Maturity Model)
- 121 • NERC ES-ISAC (Electricity Sector Information Sharing and Analysis Center)
- 122 • ICS-CERT
- 123 • ISO 27002
- 124 • SANS 20 Critical Controls

125
126 **8. What are the current regulatory and regulatory reporting requirements in the**
127 **United States (e.g. local, state, national, and other) for organizations relating to**
128 **cybersecurity?**

129 Tacoma Power as a Bulk Power System owner/operator is regulated by the North
130 American Electric Reliability Corporation (NERC) Reliability Standards, per Section 215
131 of the Federal Power Act. The NERC CIP Standards reflect the cybersecurity standards
132 enforced by NERC. NERC has delegated the enforcement authority to eight regional
133 entities. The Western Electricity Coordinating Council (WECC) has responsibility for
134 Tacoma Power. Tacoma Power is responsible for reporting to WECC, NERC and
135 FERC.

136 **9. What organizational critical assets are interdependent upon other critical**
137 **physical and information infrastructures, including telecommunications, energy,**
138 **financial services, water, and transportation sectors?**

Tacoma Public Utilities NIST Cybersecurity Framework RFI Comments

139 Tacoma Power is dependent upon the water and transportation sector services, and
140 has some reliance on the communications sector. However, like many utilities, much of
141 Tacoma Power's communications infrastructure is on a private network. Many of the
142 local critical infrastructure sectors within the region are dependent upon Tacoma
143 Power's service delivery.

144 **10. What performance goals do organizations adopt to ensure their ability to** 145 **provide essential services while managing cybersecurity risk?**

146 Tacoma Power has developed a strategic plan that maps out the organization's goals
147 and initiatives short and long term. Emphasis have been placed on areas that support
148 managing cybersecurity risk, such as; manage IT assets, leverage and enhance
149 technology, and maintain a focus on compliance and safety. These goals cascade down
150 to the business unit goals and ultimately to the individual employee goals, each level of
151 performance supporting the overall goal. Quarterly assessments by senior
152 management help identify areas where greater controls or attention may be needed.

153 Key Performance Indicators (KPI) are a method to measure the performance of a
154 system. Because Tacoma Power falls under NERC Reliability Standards enforcement,
155 each of the requirements provides a KPI to measure performance. Enforcement is
156 based on a 100% compliance level, with penalties for non-compliance.

157 Tacoma Power has developed KPIs associated with the CIP cybersecurity standards
158 and requirements.

159 **11. If your organization is required to report to more than one regulatory body,** 160 **what information does your organization report and what has been your** 161 **organization's reporting experience?**

162 Tacoma Power as a Bulk Power System owner/operator is regulated by the North
163 American Electric Reliability Corporation (NERC) Reliability Standards, which are
164 enforced by WECC within the region. These standards have embedded within them
165 various reporting requirements with regard to disturbances or unusual occurrences,
166 suspected or determined to be caused by sabotage, as well as cybersecurity incidents
167 related to critical cyber assets. Tacoma Power is also required to report cybersecurity
168 incidents to the NERC ES-ISAC. The ES-ISAC also routinely exchanges information
169 with leading industry technology and services vendors. Any regulatory related
170 information gets reported to WECC who reports it to NERC who then reports it FERC.

171 **12. What role(s) do or should national/international standards and organizations** 172 **that develop national/international standards play in critical infrastructure** 173 **cybersecurity conformity assessment?**

Tacoma Public Utilities NIST Cybersecurity Framework RFI Comments

174 Assessment of standards conformity is seen as a necessity. Within the Electricity
175 Subsector, NERC has delegated assessment to the eight regional entities.

176 There are certification programs for many of the general frameworks mentioned in
177 question #2, (i.e. ISO certification,) however the maturity of these certification programs
178 is not on par with the standards they are meant to certify. There is no inherent
179 consistency between the programs of certified businesses. The reason for this may be
180 that the entities being assessed are responsible for specifying the scope of their
181 protected environment themselves. If this concept were replaced with a sector-specific
182 risk based scope, as seen with the NERC-CIP Standards, the assessments could be
183 effective.

184 Additionally, these assessment bodies are maturing, and expanding as businesses
185 addresses their need to prove their security readiness. They are therefore not currently
186 staffed sufficiently to provide this assessment authority to a larger scope.

187 In the electricity subsector, NERC currently plays a key role in overseeing and enforcing
188 industry compliance with CIP standards through well-established processes and
189 procedures rooted in Federal Power Act, Section 215. In addition, NERC and the
190 electricity subsector actively develop and refine mandatory cybersecurity standards
191 aimed at threat identification and protection of key physical and cyber assets. As NERC
192 points out in its comments, the CIP standards create a baseline for stakeholders to
193 adopt security best practices and resources into their organizations, while remaining
194 sufficiently flexible to account for the dynamic nature of technology and emerging
195 threats. NERC and the ES-ISAC facilitate this process by providing tools to industry
196 which are essential to the electric subsector's ability to effectively assess new threats
197 and vulnerabilities.

198

199 **Use of Frameworks, Standards, Guidelines, and Best Practices**

200 As set forth in the Executive Order, the Framework will consist of standards, guidelines,
201 and/or best practices that promote the protection of information and information systems
202 supporting organizational missions and business functions.

203 NIST seeks comments on the applicability of existing publications to address
204 cybersecurity needs, including, but not limited to the documents developed by:
205 international standards organizations; U.S. Government Agencies and organizations;
206 State regulators or Public Utility Commissions; Industry and industry associations; other
207 Governments, and non-profits and other non-government organizations.

Tacoma Public Utilities
NIST Cybersecurity Framework RFI Comments

208 NIST is seeking information on the current usage of these existing approaches
209 throughout industry, the robustness and applicability of these frameworks and
210 standards, and what would encourage their increased usage. Please provide
211 information related to the following:

212 **1. What additional approaches already exist?**

213 General Information Security Frameworks:

- 214 • ISO 27000 Information Security Management
- 215 • ITIL
- 216 • Common Criteria
- 217 • Cobit v5
- 218 • SANS 20 Critical Security Controls

219

220 Federal Guidelines:

- 221 • NIST FIPS 200 & SP 800-53

222 Industrial Controls based:

- 223 • ISA-99 Security Guidelines
- 224 • NIST SP 800-82

225

226 Electricity Subsector Specific:

- 227 • NERC CIP Standards
- 228 • ES-C2M2 (DOE - Electricity Subsector Cybersecurity Capability Maturity Model)
- 229 • DOE Electricity Subsector Cybersecurity Risk Management Process (RMP)
- 230 guideline

231

232 **2. Which of these approaches apply across sectors?**

233 All of the above have applicability cross-sector. The electricity subsector specific
234 examples can easily be tailored to more general frameworks.

235 **3. Which organizations use these approaches?**

236 The general approaches are in use globally by thousands of organizations in many
237 business sectors.

238

239 NERC Reliability Standards apply to all “users, owners and operators” of the bulk power
240 system (BPS), which is the subset of the Electricity Subsector that deals with reliability
241 of the transmission network, generally including the parts of the electric grid responsible
242 for higher voltage and larger quantities of electricity activity. As provided in Federal

**Tacoma Public Utilities
NIST Cybersecurity Framework RFI Comments**

243 Power Act Section 215, the NERC Standards do not cover “facilities used in the local
244 distribution of electric energy.”

245

246 **4. What, if any, are the limitations of using such approaches?**

247 The more general standards or frameworks are limited by the application of the
248 standard to individual organizations, and the authority of the governing bodies providing
249 certification or accreditation. Without regulation, these frameworks can be misused or
250 misapplied, and do not provide the consistency of delivery sought through this process.
251 Vendor management is typically not addressed by these frameworks or approaches. In
252 the case of critical infrastructure, lack of proper vendor management and oversight is a
253 key facet of the cybersecurity risk. In addition, timely access to actionable threat and
254 vulnerability information will go far to ensure organizations are more agile both in their
255 ability to respond to emerging threats, and to adjust their control selections ahead of
256 formal guidance.

257

258 **5. What, if any, modifications could make these approaches more useful?**

259 Providing regulatory authority for setting the mandatory standards for the resulting
260 framework will go a long way in providing the desired consistency of cybersecurity,
261 much like what has been achieved in the Electricity Subsector through NERC-CIP.

262 Additional processes must also be developed for information sharing at the national,
263 regional and local levels.

264 Adding vendor management is also seen as a useful modification.

265

266

267 **6. How do these approaches take into account sector-specific needs?**

268 The NERC CIP’s identified the critical assets and associated cyber assets that relate to
269 the reliable operation of the bulk electric system (BES). This methodology took into
270 account the unique attributes of the electricity subsector and the BES and developed
271 controls that do not inhibit the availability requirements of the systems. The DOE RMP
272 and ES-C2M2 guidelines that were developed specifically for the electricity sector
273 include the determination of the different disciplines within the sector (e.g. energy
274 generation, transmission, distribution, buying and selling markets and corporate
275 operations).

276 **7. When using an existing framework, should there be a related sector-specific
277 standards development process or voluntary program?**

Tacoma Public Utilities
NIST Cybersecurity Framework RFI Comments

278 We note that current NERC reliability standards are mandatory. Sector-specific
279 standards should be applied to existing frameworks, since each sector has a different
280 threat and vulnerability profile. While many real-time systems, as employed in the
281 electricity subsector, have analogues in other sectors, there are many systems that are
282 dissimilar.

283 Where there is an existing mandatory framework in place, like the electricity subsector's
284 NERC-CIP, care must be taken in not forcing adherence to dual standards, or creating
285 standards that might conflict with current requirements.

286

287 **8. What can the role of sector-specific agencies and related sector coordinating**
288 **councils be in developing and promoting the use of these approaches?**

289 The sector-specific agencies (SSA) and coordinating councils (CC) can play an
290 important role in communicating with industry on the threats and vulnerabilities. Since
291 the SSA's and CC's have a closer alignment with the operations of their sector, they
292 have a unique opportunity to bring together industry to develop case studies related to
293 the implementation and adoption of the framework. These case studies can be used to
294 develop uniformity across the sector. The SSA's and CC's have specific
295 understandings of the unique attributes of their sector and can assist with the
296 development of risk based measures so the adoption of the framework is
297 commensurate with risk and operations of the sector organization.

298

299 **9. What other outreach efforts would be helpful?**

300 The SSA's and CC's can be the coordinators in the establishment of the public-private
301 partnerships with industry as well as establishing collaboration across sectors. Where
302 there are interdependencies between critical infrastructures, there is an opportunity for
303 the SSA's and CC's to create information sharing and analysis that can be used to
304 facilitate cross-sector understanding of threats and vulnerabilities. The SSA's and CC's
305 can leverage economies of scale across sectors to improve the overall national
306 cybersecurity posture. Using the Information Sharing and Analysis Centers (ISAC) for
307 each sector, organizations can share with the ISAC specific log information that the
308 ISAC can then use to correlate events across their sector and create reports and
309 analysis as needed. Additionally, the SSA's and CC's can be an aggregator among the
310 different critical infrastructures of log information to create a view across sectors and
311 across interdependent sectors. From a public-private perspective, developing this scale

Tacoma Public Utilities NIST Cybersecurity Framework RFI Comments

312 of bi-directional security information has the potential to dramatically increase the
313 security posture of each sector and the nation.

314

315 **Specific Industry Practices**

316 In addition to the approaches above, NIST is interested in identifying core practices that
317 are broadly applicable across sectors and throughout industry.

318 NIST is interested in information on the adoption of the following practices as they
319 pertain to critical infrastructure components:

- 320 • Separation of business from operational systems;
- 321 • Use of encryption and key management;
- 322 • Identification and authorization of users accessing systems;
- 323 • Asset identification and management;
- 324 • Monitoring and incident detection tools and capabilities;
- 325 • Incident handling policies and procedures;
- 326 • Mission/system resiliency practices;
- 327 • Security engineering practices;
- 328 • Privacy and civil liberties protection.

329

330 **1. Are these practices widely used throughout critical infrastructure and** 331 **industry?**

332 The nine practices listed in the RFI are in use by Tacoma Power and widely used
333 throughout the Electricity Sub-sector and addressed within the current NERC-CIP
334 Standards. NERC Standards, CIP-002 through CIP-009, provide specific actions for
335 owners and operators to perform to protect critical cyber assets that support reliable
336 operation of the bulk power system (BPS). These standards recognize the differing
337 roles of each entity in the operation of the BPS, the criticality and vulnerability of the
338 assets needed to manage BPS reliability, and the risks to which they are exposed.
339 Many of the concepts within the CIP Standards are generic in nature and agnostic
340 towards specific technology regarding security solutions.

341 **2. How do these practices relate to existing international standards and** 342 **practices?**

343 The new NERC-CIP Standards (Version 5) generally cover the same subject areas as
344 both the NIST FISMA framework and the ISA-99 Standards, along with the standards
345 that they also reference.

**Tacoma Public Utilities
NIST Cybersecurity Framework RFI Comments**

346 **3. Which of these practices do commenters see as being the most critical for the**
347 **secure operation of critical infrastructure?**

348 All of these practices are important for the secure operations of critical infrastructure. It
349 is the degree of implementation that needs to be managed to ensure that
350 implementation of these controls do not impede the reliable operations of the systems
351 and business processes. The degree of implementation needs to be balanced with the
352 overall risk (i.e. threats, vulnerabilities, and likelihood/consequence of harm) to the
353 systems.

354 Referencing the specific practices listed in this section, the “separation of business from
355 operational systems” is one of the most critical controls for the secure operation of
356 critical infrastructure. The implementation of this practice can greatly reduce the overall
357 attack surface. It is important for organizations to use this practice to create a clear
358 demarcation in their network and system architectures. The sensitivity related to
359 operational systems is much different than the sensitivity related to corporate systems.

360 **4. Are some of these practices not applicable for business or mission needs**
361 **within particular sectors?**

362 All of these controls are applicable cross-sector.

363 **5. Which of these practices pose the most significant implementation challenge?**

364 The most significant implementation challenge within the bulk power system is ensuring
365 that entities adequately protect their operational systems (control systems, SCADA,
366 etc.) from un-trusted sources.

367 The most significant implementation challenge, within the listed practices above, involve
368 the “monitoring and incident detection tools and capabilities” practice. Recent events in
369 multiple sectors have demonstrated that advanced persistent threats (APT) have
370 significant, technically-capable personnel and sufficient resources to attack and
371 overcome some of the most dedicated security programs in the world. However,
372 defenders against APT attacks are often at the other end of the scale in terms of
373 personnel and resources, both in-house and through third parties. Threat information
374 sharing between government and industry is extremely important, but—even with robust
375 tools and capabilities to monitor and detect incidents within critical infrastructure
376 controls and systems—the security threat from APTs is continually evolving with new
377 methods of attack.

378 **6. How are standards or guidelines utilized by organizations in the**
379 **implementation of these practices?**

**Tacoma Public Utilities
NIST Cybersecurity Framework RFI Comments**

380 All Electricity Sub-sector participants that are users, owners and operators of the bulk
381 power system are required to follow all NERC Reliability Standards, including the
382 Critical Infrastructure Protection standards. Entities also voluntarily follow guidance
383 developed and issued by NERC and others such as NIST, International Society of
384 Automation (ISA), International Electrotechnical Commission (IEC), and the
385 International Organization for Standards (ISO).

386 **7. Do organizations have a methodology in place for the proper allocation of**
387 **business resources to invest in, create, and maintain IT standards?**

388 Tacoma Power has developed a mature program to manage IT standards to maintain
389 compliance to NERC Standards and Requirements. Tacoma Power has a Reliability
390 and Compliance organization, as well as project management office to manage both the
391 compliance implications and delivery of IT projects. Both utilize standard methodologies
392 in delivering on their responsibilities to the organization. Delivering on the NERC-CIP
393 requirements provides an information security management system to the business.

394 **8. Do organizations have a formal escalation process to address cybersecurity**
395 **risks that suddenly increase in severity?**

396 Tacoma Power has developed a Cybersecurity Incident Response Plan to address the
397 escalation needs in the face of a cybersecurity incident.

398 Additionally, Tacoma Power complies with NERC CIP standards, which requires
399 reporting for significant incidents to the ES-ISAC.

400 The NERC Alert System addressing such matters has been implemented and
401 formalized across the industry for registered entities. As defined by NERC Rules of
402 Procedure, alerts are divided into three distinct levels:

- 403 1. Industry Advisory - Purely informational, intended to alert registered entities to
404 issues or potential problems. A response to NERC is not necessary
- 405 2. Recommendation to Industry - Recommend specific action be taken by
406 registered entities. Require a response from recipients as defined in the alert
- 407 3. Essential Action - Identify actions deemed to be "essential" to bulk power system
408 reliability. Requires NERC Board of Trustees approval prior to issuance. Similar
409 to recommendations, essential actions also require recipients to respond as
410 defined in the alert

411 **9. What risks to privacy and civil liberties do commenters perceive in the**
412 **application of these practices?**

Tacoma Public Utilities NIST Cybersecurity Framework RFI Comments

413 City of Tacoma, dba Tacoma Public Utilities is a municipal organization that is subject to
414 Washington State public disclosure requests. Washington State code RCW 42.17.310,
415 exempts municipal organizations like Tacoma Power from disclosing information
416 regarding critical infrastructure.

417 Risks may include sharing sensitive information regarding authorization of users
418 accessing systems. Individuals' names are tied to the authorizations, which may raise
419 privacy and civil liberties concerns, particularly if an incident occurs.

420 **10. What are the international implications of this Framework on your global**
421 **business or in policymaking in other countries?**

422 Not Applicable.

423 **11. How should any risks to privacy and civil liberties be managed?**

424 Information sharing should be managed, removing any PII (or BII) information, from
425 publicly disclosed notifications. ISAC organizations should be cognizant of any
426 regulatory implications, and work to maintain privacy.

427 Regulatory and Federal organizations should support open sharing without risk to
428 privacy or compliance implication.

429 **12. In addition to the practices noted above, are there other core practices that**
430 **should be considered for inclusion in the Framework?**

431 From the SANS 20 Critical Security Controls by order of delivery preference:

- 432 • Secure Configurations for Hardware and Software on Mobile Devices, Laptops,
433 Workstations, and Servers
- 434 • Continuous Vulnerability Assessment and Remediation
- 435 • Malware Defenses
- 436 • Application Software Security
- 437 • Wireless Device Control
- 438 • Data Recovery Capability
- 439 • Security Skills Assessment and Appropriate Training to Fill Gaps
- 440 • Secure Configurations for Network Devices such as Firewalls, Routers, and
441 Switches
- 442 • Limitation and Control of Network Ports, Protocols, and Services
- 443 • Controlled Use of Administrative Privileges
- 444 • Boundary Defense
- 445 • Maintenance, Monitoring, and Analysis of Audit Logs
- 446 • Controlled Access Based on the Need to Know

Tacoma Public Utilities
NIST Cybersecurity Framework RFI Comments

- 447 • Data Loss Prevention
- 448 • Penetration Tests and Red Team Exercises

449

450 Additionally as stated earlier, vendor management and information sharing are key
451 areas of concern.
