Hello,

I just had an opportunity to review the draft of the AI risk management framework and had a few questions/comments I would like to address for review. As someone who is new to the field, I am looking to grow more in my understanding of the AI industry and am using this framework as a first step to gain insight. My comments/questions are listed below:

Section 6: AI RMF Core: The chart within this section (figure 5), lists the different functions related to the handling of AI risks. In addition to governing, my thought was sustainability would be included for the continued managing and awareness of the AI risk management policies currently in place.

Section 5.2.5 For "Managing Bias" it states that three main categories in AI are systemic, computational and human. It would be helpful to list a few examples, potentially a chart breaking down each of these categories for further elaboration.

Thank you for reviewing these comments. I look forward to the review of the next draft.

Sincerely,
Dominique Owens
