

# Enabling Facility-Level Interoperability Between Robot Teams and Machine Cell Devices

SOUTHWEST RESEARCH INSTITUTE

rosindustrial.org

# Improved Interoperability

---

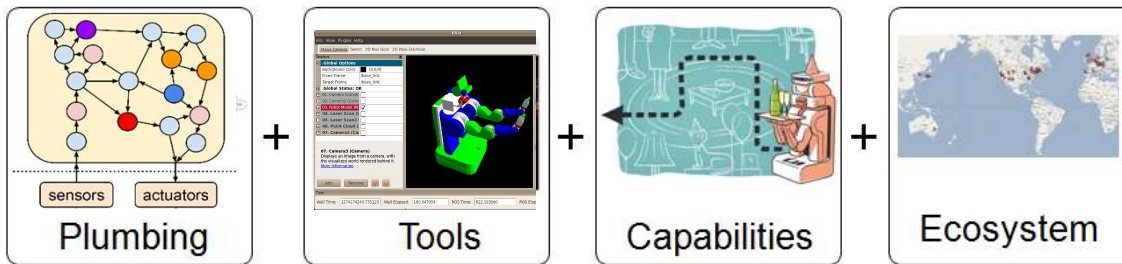

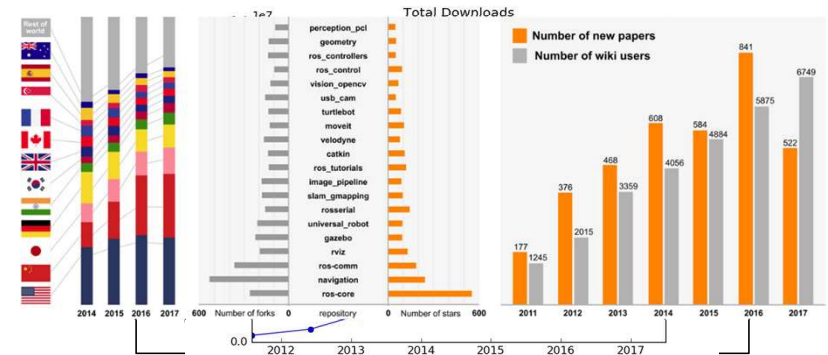

- Building on 2013 work to create “generic bridge” between MTConnect and ROS
- Break down the well-documented language barrier in factories
- Enable for industry-wide adoption of open-source technologies
  - Providing a use-case(s) and testbed showcasing lower cost solutions for comprehensive factory floor integration for small- and medium-sized manufacturers

<https://youtu.be/hnDKqr-g3t4>

# ROS: Robot Operating System – Why?

- Research Robotics
  - Reinvention of the Wheel
  - Little Commonality
  - Short Lifespan
  - Inability to Compare Results

- Open source (BSD)
- Established to keep robotics researchers from “re-inventing the wheel”
- Maintained by OSRF – 10 years strong!
- Reusable software components
- >1,000,000 users downloaded/mo. <sup>1</sup>

Target Adopter is a Low-Lot High Mix Manufacturing Site

## Scan-N-Plan Foundation

Opportunity 73% ROI based on overall part processing area efficiency improvements via reduction in variable labor

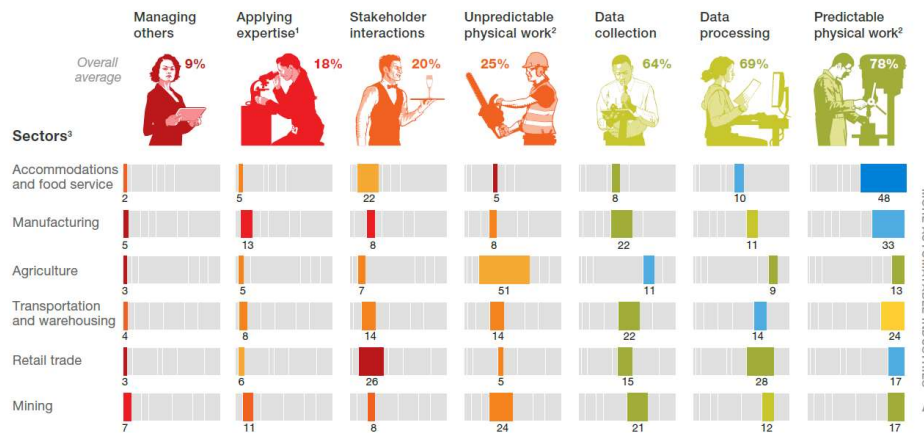

# Attacking End-User Opportunities

- Factories by Product
  - Lines by Model
- Underutilized Resources

# Evolution of Automation

- Recent reports highlight evolution of automation
- Perception is that Manufacturing Work is nearer to complete automation
- For larger fabrication scenarios this work may be more appropriately defined as 'Unpredictable Physical Work'
- This is where the development of ROS-Industrial plays a key role

Source: <http://www.mckinsey.com/business-functions/digital-mckinsey/our-insights/where-machines-could-replace-humans-and-where-they-cant-yet>

# Value Stream Optimization

- The automated solution is only as successful as its inputs, supporting process steps, reliability, and quality of output
- Merging ROS-Industrial and the initiatives around Digital Manufacturing/IoT, improved efficiencies in operations can be realized

# Closed Loop Agile Process

- CAD+Scan to Path
- Closed Loop QA
- Improved Order to Delivery
- Improved Product to Market
- Reduced Losses during Product Change
- Enables ability to apply novel optimization and deep learning techniques for dynamic continuous improvement

# Coordinated Cooperative Use-Case

- 2 Mobile Industrial Robots need to work in a coordinated fashion to load a large CNC
- Reference case – large spline shaft loaded into CNC lathe

# Profitability through Flexibility

---

- Demonstrated Cases of Impact on Improved Utilization of Assets
  - New Capability in Legacy Assets
  - Increased Flexibility
- Reduction in Non-Value/Low-Value Added Variable Labor
  - Often high risk jobs
  - Typically tasks subject to over-processing/little control
- Flexibility to be able to shift production closer to Market as demand shifts geographically; optimize outside the four walls
- Reduced overhead to support due to greater capability in variation management
- Improved accessibility to technology for the SME
