

Better Together: Extending Nestor with Technical Documentation

Jim Kukla

Co-Founder/CTO @ RedShred

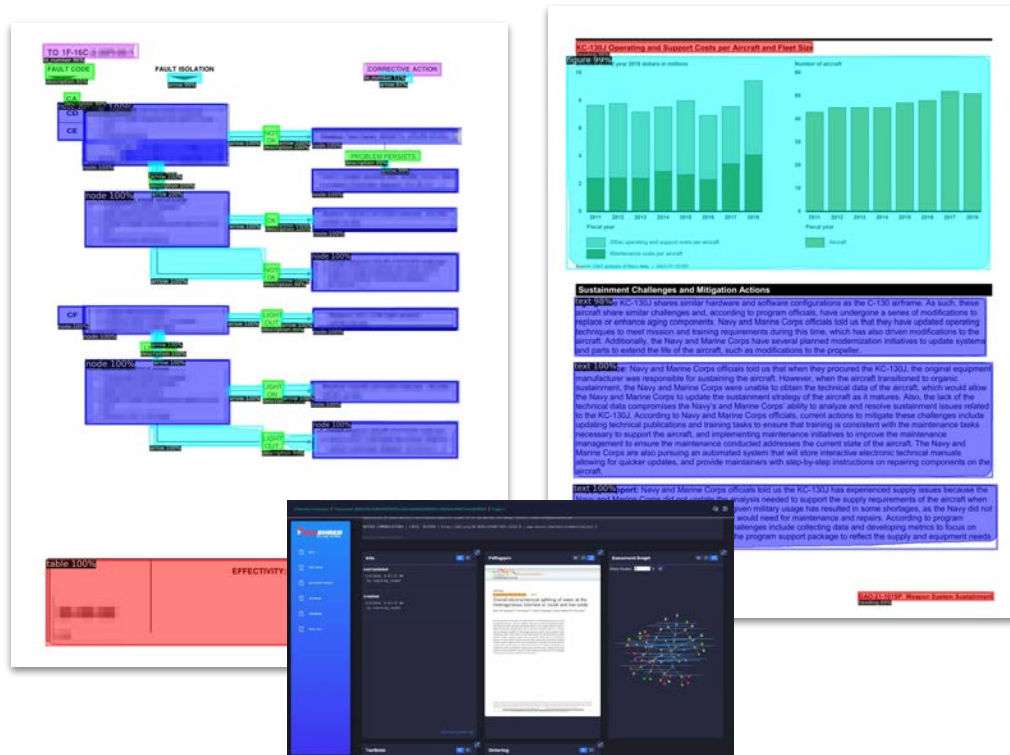

Our journey to TLP

- Started with SBIR with USAF for processing **unstructured technical orders** into **structured form**
- Goals:
 - **Accelerate troubleshooting**
 - Improve **mission-capable rates**
 - Enable **predictive maintenance**
 - Extract structured information to integrate with databases
- Realized linking with MWO notes would be a separate challenge
 - Enter: Mike and Thurston

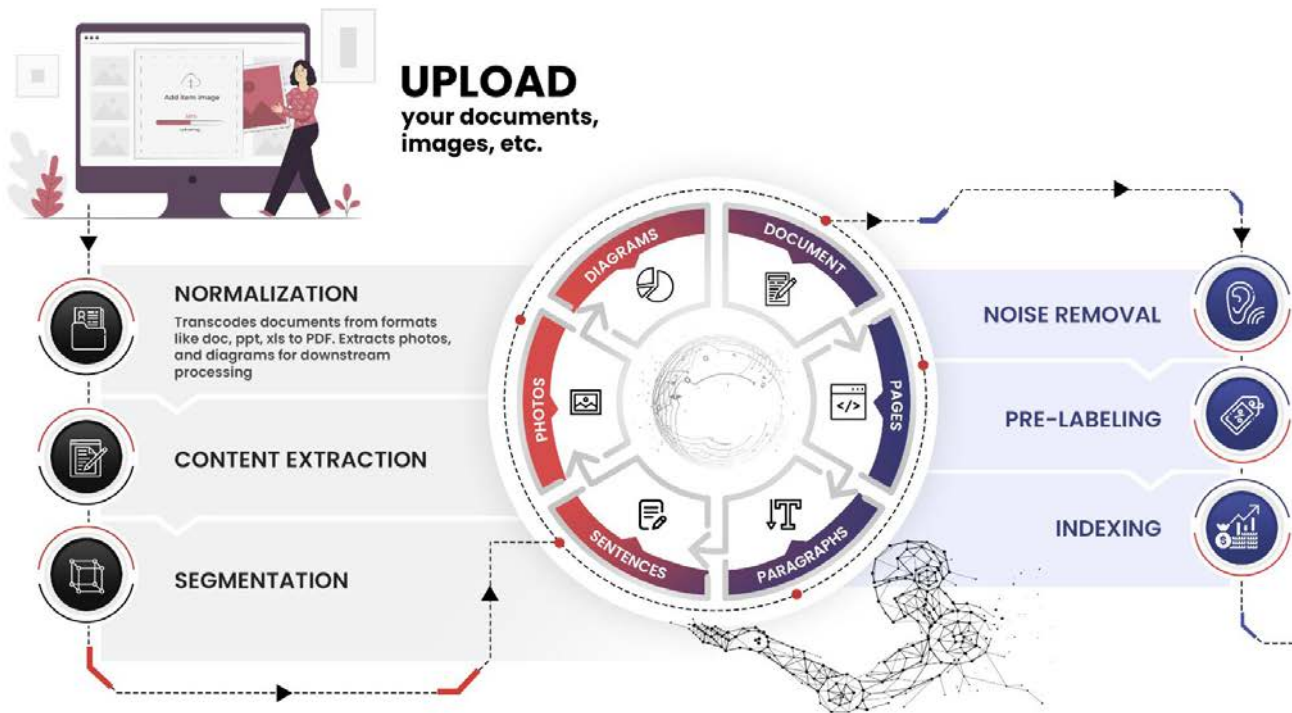

RedShred: Your Documents as a Database

- API-first platform
 - Hybrid **vision and NLP** extraction and segmentation
 - Text, pictures, diagrams, tables
 - **Full-text** and **enrichment metadata** search
 - Easy to **integrate into downstream applications**
- Collaboration
 - Collection dashboard and **feedback APIs**

RedShred: Your Documents as a Database

- Configurable **segmentation**, **extraction** and **enrichment**
- **Enrichments** allow you to **extract tailored metadata** for your content (NLP, embeddings, figure analysis, etc.)
- Supports **proprietary**, **open source**, and **third-party API** enrichments
- **Centralized resource to collaborate** and **maximize the value** you get from **your documents**

RedShred + NIST in 2020

- RedShred provides programmatic access to **technical documentation** ...
- Nestor provides rapid **tagging and annotation** for **MWOs** ...
- 2020 NIST SBIR - **Extended Nestor Tagging**
 - The goal is to **extend what Nestor does** and tie it to **large documents in RedShred**
 - **MWOs + Technical Documentation**

Extending Nestor

1. Pluggable metrics
2. Concurrency
3. Custom Tags and Custom Classes
4. Integrated scoring feedback
5. Continuous on-the-fly deployment of tag models as an API
6. Integrated comparative visualizations

1. Pluggable Metrics

- Similarity
 - Edit-distance
 - **Embeddings**

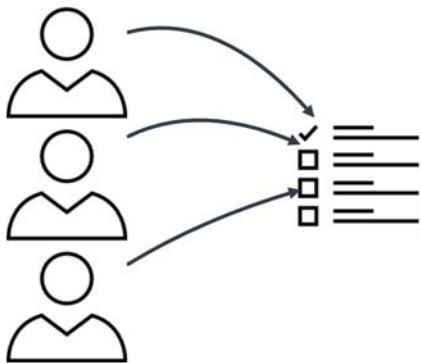

- Ranking
 - TF-IDF
 - **Weighting from business value columns**

Embeddings from content fuel similarity and **tags** from Nestor become training data

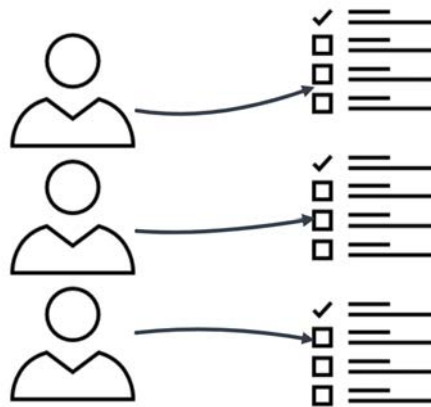

On-the-fly swapping to maximize **coverage** of synonyms

2. Concurrency

- Shared tag model

- Independent tag models

3. Custom Tags and Custom Classes

- Arbitrary tags
- Item/Problem/Solution classification
- Ambiguous/Irrelevant classification
- Arbitrary tags
- **User-defined multi-class attributes**
 - Item/Problem/Solution classification
 - Ambiguous
 - Irrelevant
 - Department
 - Team
 - External link (database, catalog, etc.)

4. Integrated Scoring Feedback

- Allow users to **thumbs up/down individual examples in context**
- **Measures performance** of tag application
 - Recorded as **ground truth**
- From tags towards **training data for named-entity recognition (NER) models**
 - Facilitates links from MWOs to technical documentation

Terms in Context

The screenshot displays a vertical list of text blocks, each representing a context for a tag. To the right of each block are two small icons: a thumbs up and a thumbs down. At the bottom of the list is a progress bar labeled 'Matches' with a teal segment on the left and a grey segment on the right. Three orange callout boxes with arrows point to specific elements: the first points to a thumbs up icon, the second points to a thumbs down icon, and the third points to the 'Matches' progress bar.

Mark thumbs up if the tag makes sense here, down otherwise.

Terms, in context with highlights. (Highlights are Task 10 and include tagging the relevant spans in the text for rendering in the UX)

May include source phrase or any selected nearby terms.

Matches

Measurement of thumbs up over total matches to show "tag coherence".

5. Continuous on-the-fly deployment

- Continuous on-the-fly deployment of a tag model as an API
 - ... and as an enrichment inside of your RedShred collection
 - Low-friction integration into point-of-data entry

6. Integrated Comparative Visualizations

- Small Multiples allow rapid comparison across metadata classes
 - Physical location (building, site)
 - Maintainer-specific tag models
 - Inter-annotator agreement for training and QA purposes

Better Together

- **Extracted knowledge from technical documentation**
 - Embeddings, language models
 - Named entities and relationships
 - Text, figures, tables, images
- **MWO insights from maintainers over time**
 - **Lived experience of fielded equipment**
 - **Personalized** to each maintainer
 - ... with immediate, continuous deployment
 - Comparisons across maintainers
 - **Collective wisdom** across teams large and small

Conclusion

- Prototype in development, beta in late 2021
- Looking for **research collaborators** and **beta testers** - hello@redshred.com

Thank you!
