

Compton Suppressed Gamma Spectroscopy of Spent Fuel Inventories

Abdullah Weiss

NCNR, Reactor Operations and Engineering Group

Background

- ▶ A little about me:
 - ▶ Texas A&M University-Kingsville (Junior Fall 2016)
 - ▶ Mechanical Engineering major, and Nuclear Engineering minor

- ▶ Project Origins:
 - ▶ Idaho National Laboratory (ATR)
 - ▶ Penn State University

- ▶ Motivation of Project:
 - ▶ To successfully determine the burnup of highly enriched uranium (HEU) fuel in the Neutron Beam Split-core Reactor (NBSR) at the NCNR.
 - ▶ Benchmark the power and burnup of the NBSR.

INL Study (2013)

A Feasibility and Optimization Study to Determine Cooling Time and Burnup of Advanced Test Reactor Fuels Using a Nondestructive Technique by Jorge Navarro

- ▶ Determined burnup and cooling time of fuel using isotopic γ ray peak area, and peak area ratios.
- ▶ Relationship was found between burnup and isotopes including ^{137}Cs , and the ratios of other isotopes correlated with the cooling time (such as $^{144}\text{Ce}/^{137}\text{Cs}$).
- ▶ Isotope ratios were correlated to cancel out the geometry of the measurement.

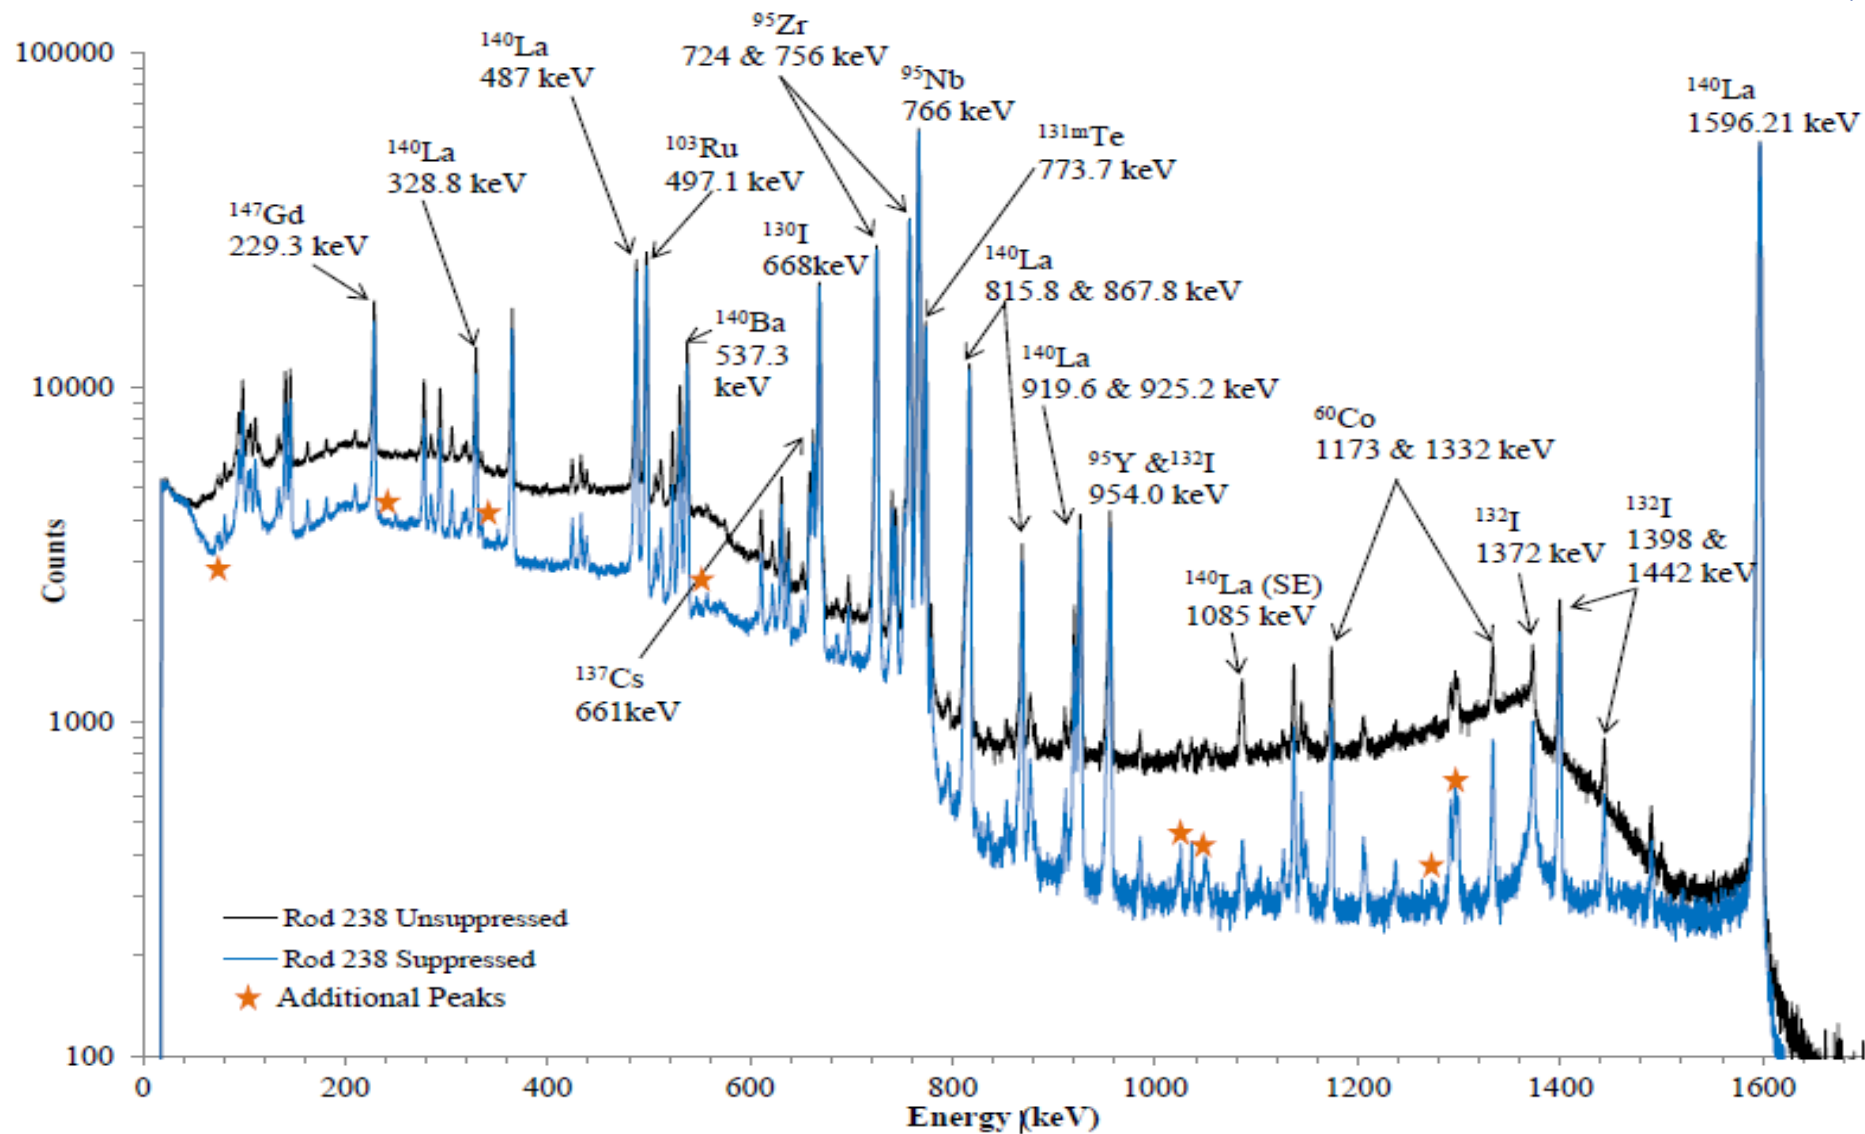

Penn State Study (2014)

Study of Compton Suppression for Use in Spent Nuclear Fuel Assay by Sarah Bender

- ▶ A fuel sample from the Penn State Breazeale Reactor was measured using Compton Suppression.
- ▶ Used concrete collimator built into the fuel pool to study aged LEU fuel.
- ▶ Eight additional photopeaks were unmasked, allowing for identification of more isotopes in the fuel sample.

Penn State Study (2014)

Compton Suppression

► Compton Scattering

$$\Delta\lambda = \frac{h}{m_e c} (1 - \cos \theta)$$

► How do we apply Compton Suppression?

Detectors Run in Anti-Coincidence

I am Arthur H. Compton, and I won the Nobel Prize in Physics

NBSR Fuel

The Reactor:

- ▶ D₂O Coolant, moderator, and reflector
- ▶ 30 fuel elements with 38.5 day fuel cycles
- ▶ ~20 MW Thermal Power

The Fuel:

- ▶ 93% U₃O₈ + Al
- ▶ 17 fuel plates per region
- ▶ 2 regions per fuel element

Burnup:

If 10% of an initial isotope underwent fission, the burnup is 10%.

In general: $\frac{MW \cdot d}{\text{Metric Tonne}} = \frac{\text{Power} \times \text{Time Spent}}{\text{Initial Mass of Fuel}}$

Fuel
Plates

Challenges

We wanted to measure spectra from different spent fuel elements using a HPGe detector and a BGO detector.

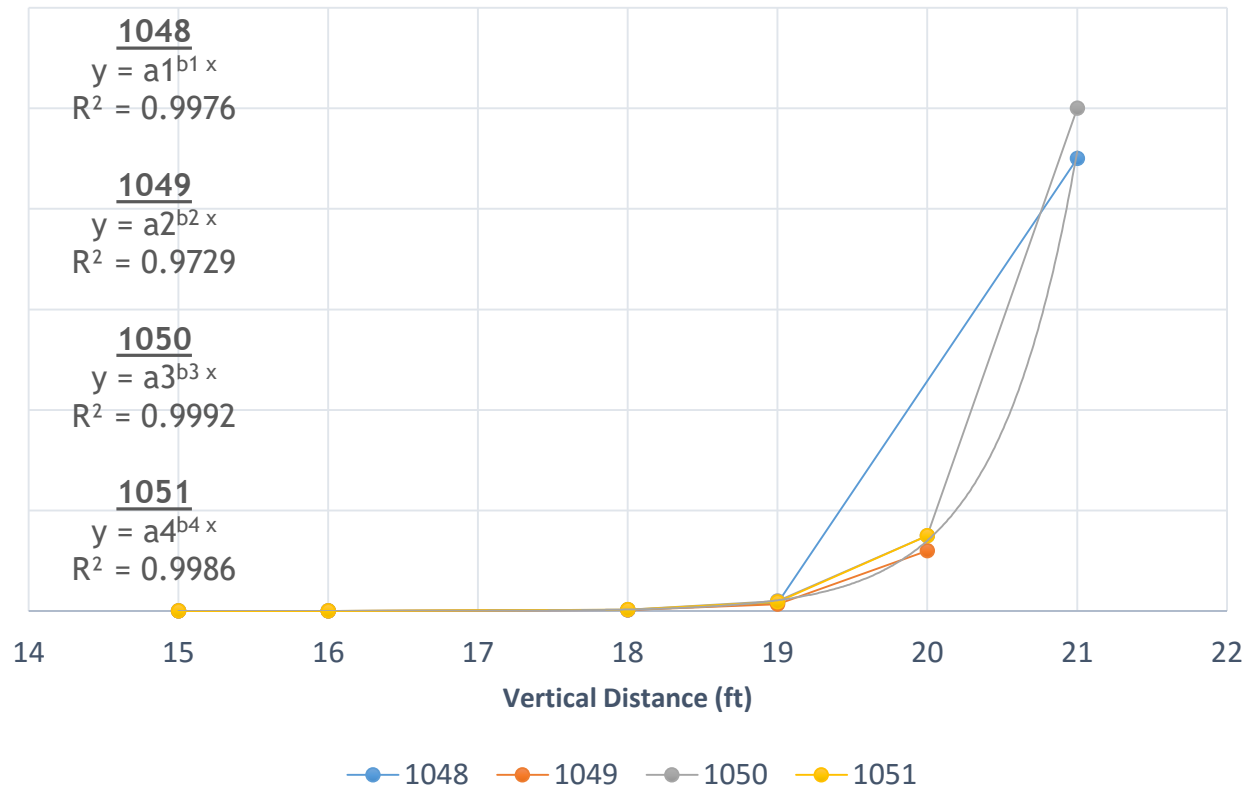

- ▶ We had to channel a γ beam from the fuel elements to the detectors.
- ▶ The detectors had to be setup in a way that accommodates Compton suppression.
- ▶ It had to be safe: health physics, crane lift, and γ beam control.
- ▶ Not a single thing besides the collimator and its peripherals was to touch the water.
- ▶ Had to be easy to assemble and disassemble for multiple uses for different γ beam sizes.
- ▶ Mechanical issues to be addressed: structure, buoyancy, material selection, manufacturing
- ▶ Cost Effectiveness
- ▶ Detectors Setup and Calibration
- ▶ **EVERYTHING MUST WORK!!!!**

Results?

Radiation Safety

Dose vs Distance From Source to Detector

Measured by Timothy Barvitskie

Questions:

1. How far down should we initially measure?

Necessities:

1. Attenuation Coefficients (μ)
2. Average Attenuation Coefficient (μ_{avg})
3. Average Tenth Value Layer (TVL)

Radiation Safety

Attenuation Coefficient (μ):

$$D = D_0 e^{-\mu x}$$

$$\mu = \frac{-\ln\left(\frac{D}{D_0}\right)}{x}$$

Tenth Value Layer (TVL):

$$TVL = \frac{\ln(10)}{\mu}$$

Calculated Results:

	μ (1/ft)	TVL (ft)
1048	1.8697	1.23
1049	1.6869	1.36
1050	1.8735	1.23
1051	1.8437	1.25
AVG	1.81845	1.27

Where do we put the detectors?

Apparatus Requirements:

- ▶ Easy to assemble/disassemble
- ▶ Mobile
- ▶ Stable

Other places that were considered:

- ▶ On the side of the pool
- ▶ In the pool (under the lid)

Where do we put the detectors?

Where do we put the detectors?

Where do we put the detectors?

The Apparatus

The Collimator

- ▶ 6' (x4)
- ▶ 1" OD - 0.93" ID
- ▶ Connected via Tube Locking Fittings

Structural Analysis

- ▶ There is a risk of dropping detectors in the pool.
- ▶ Treat system as a structural beam, and find the center of mass for the platform.
- ▶ Center of mass was within the safety zone.

$$\Sigma w = 115 \text{ lb}$$

$$\Sigma w < 400 \text{ lb}$$

$$\Sigma w < 400 \text{ lb}$$

Buoyancy Analysis

In order for the collimator to work properly, it must sink in.

Original thought:

2"OD 1.65"ID tubes for collimator

Health Physics Concerns → make Collimator smaller (1"OD, 0.93"ID)

$$F_{B,applied} = \rho_{H_2O} \times g \times V_{df,max} - w_{Col} \approx 5 \text{ lb}$$

5 lb deficit

But since it's held in place, would it REALLY bend too much?

Detector Calibration

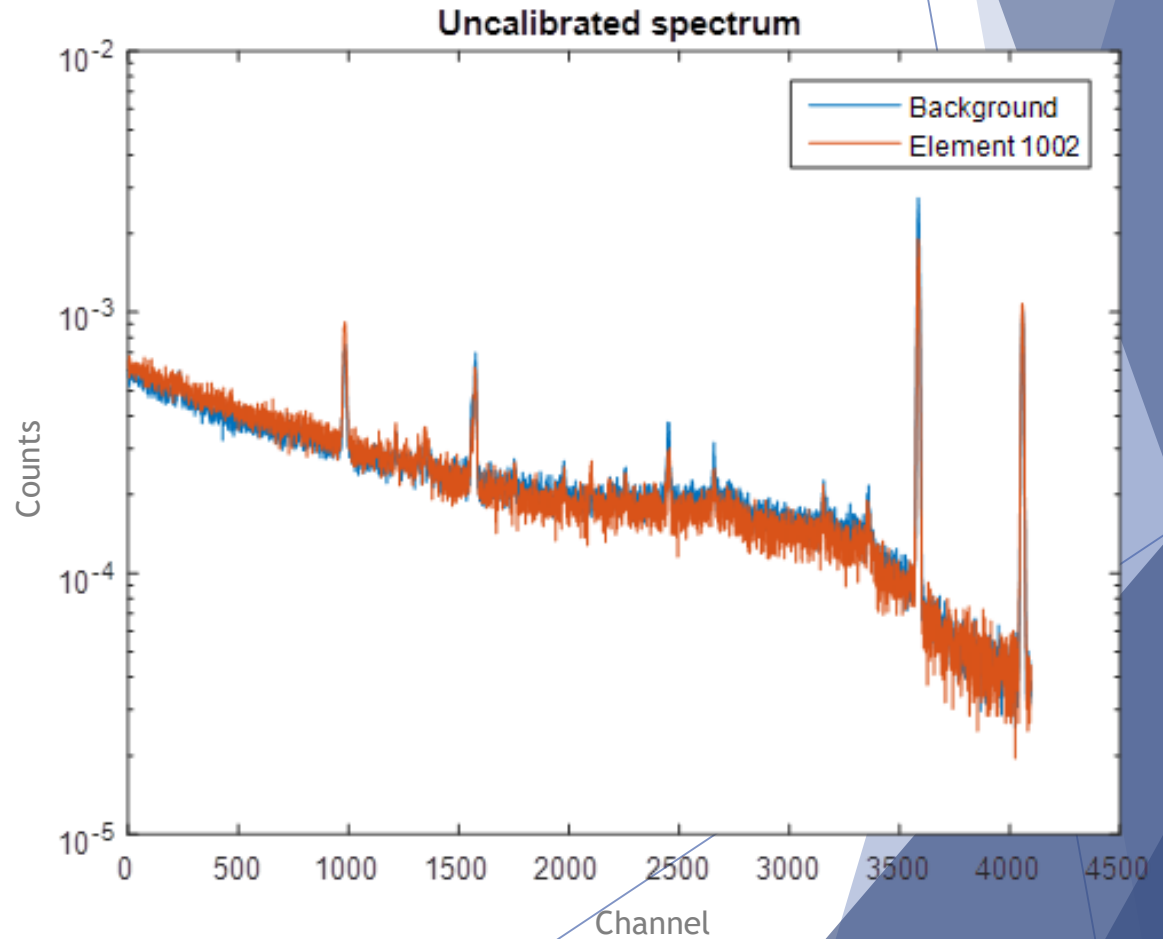

- ▶ Done using GENIE-2000
- ▶ Energy Calibration using Co-60 and Eu-154 Sources

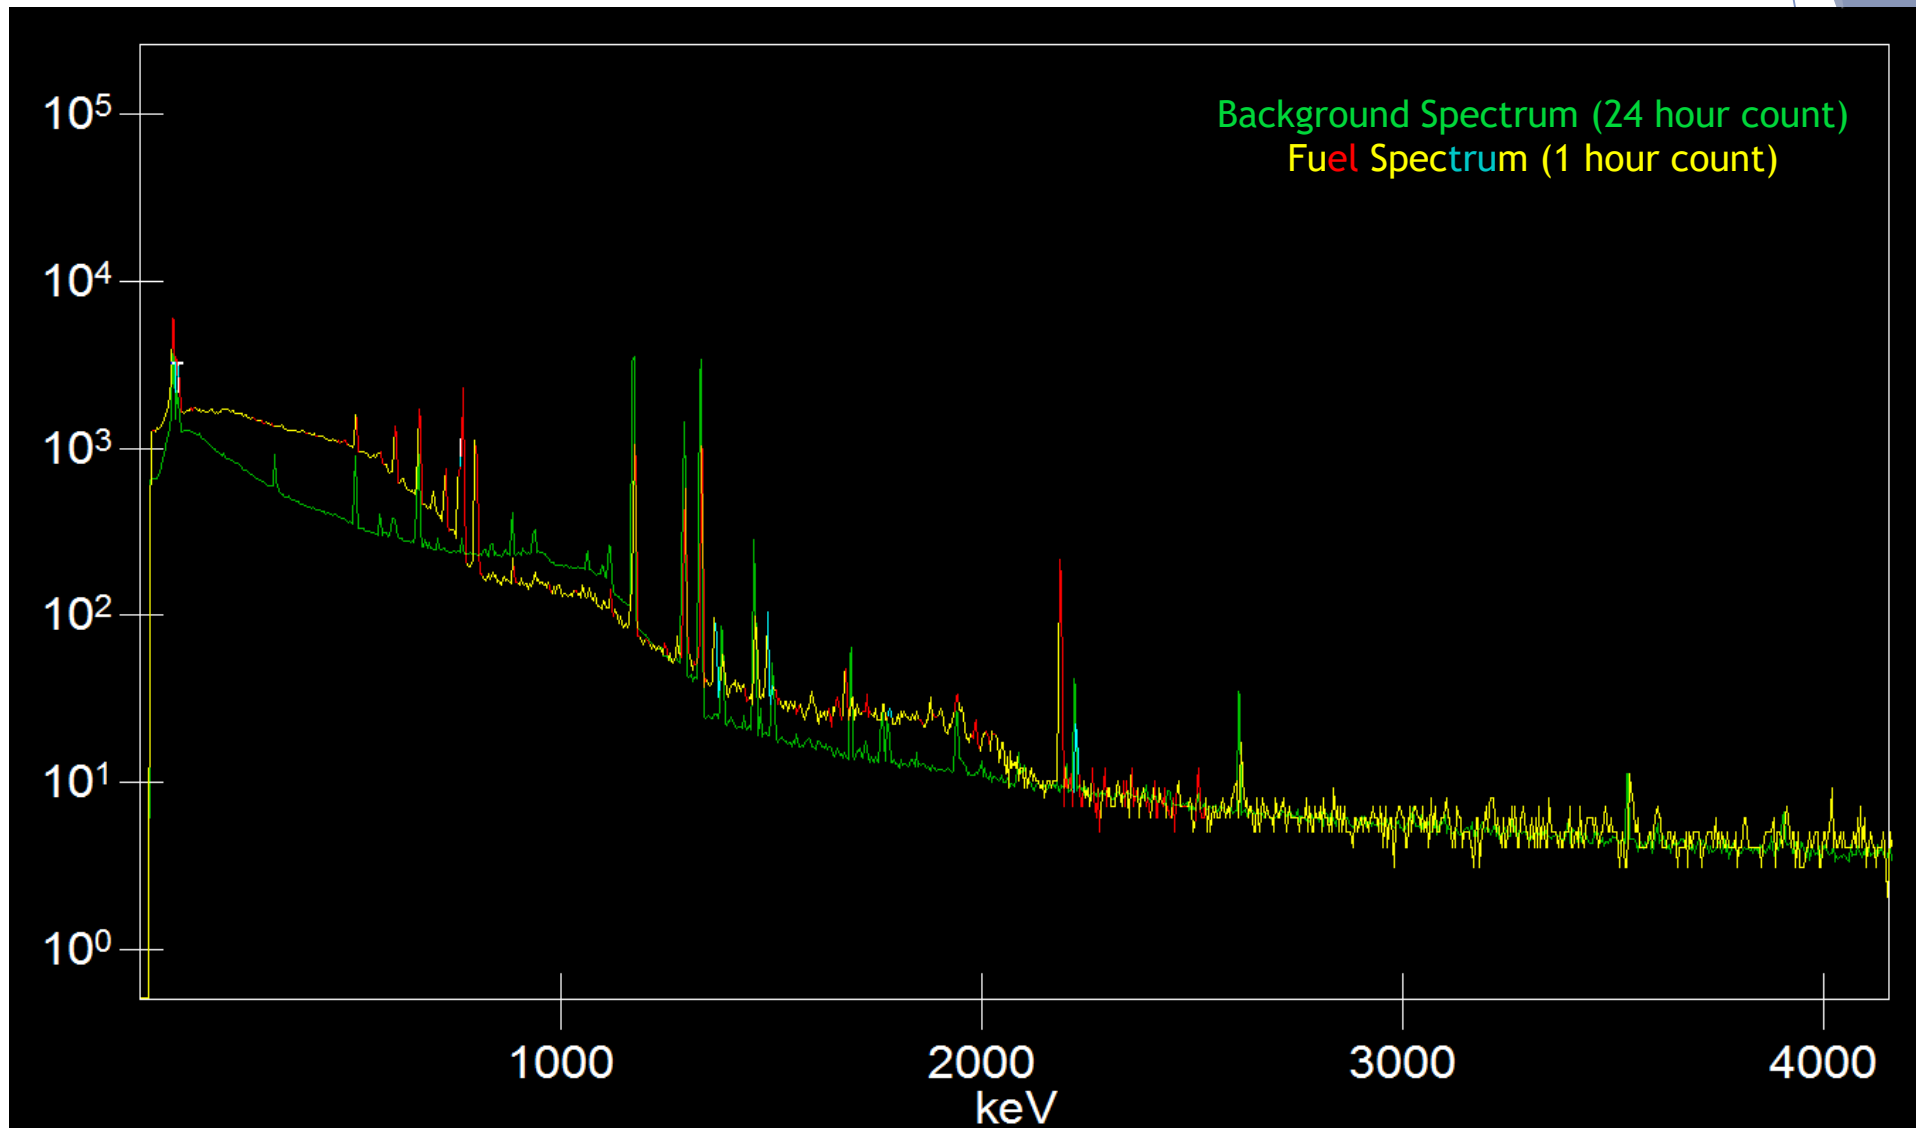

Initial Results

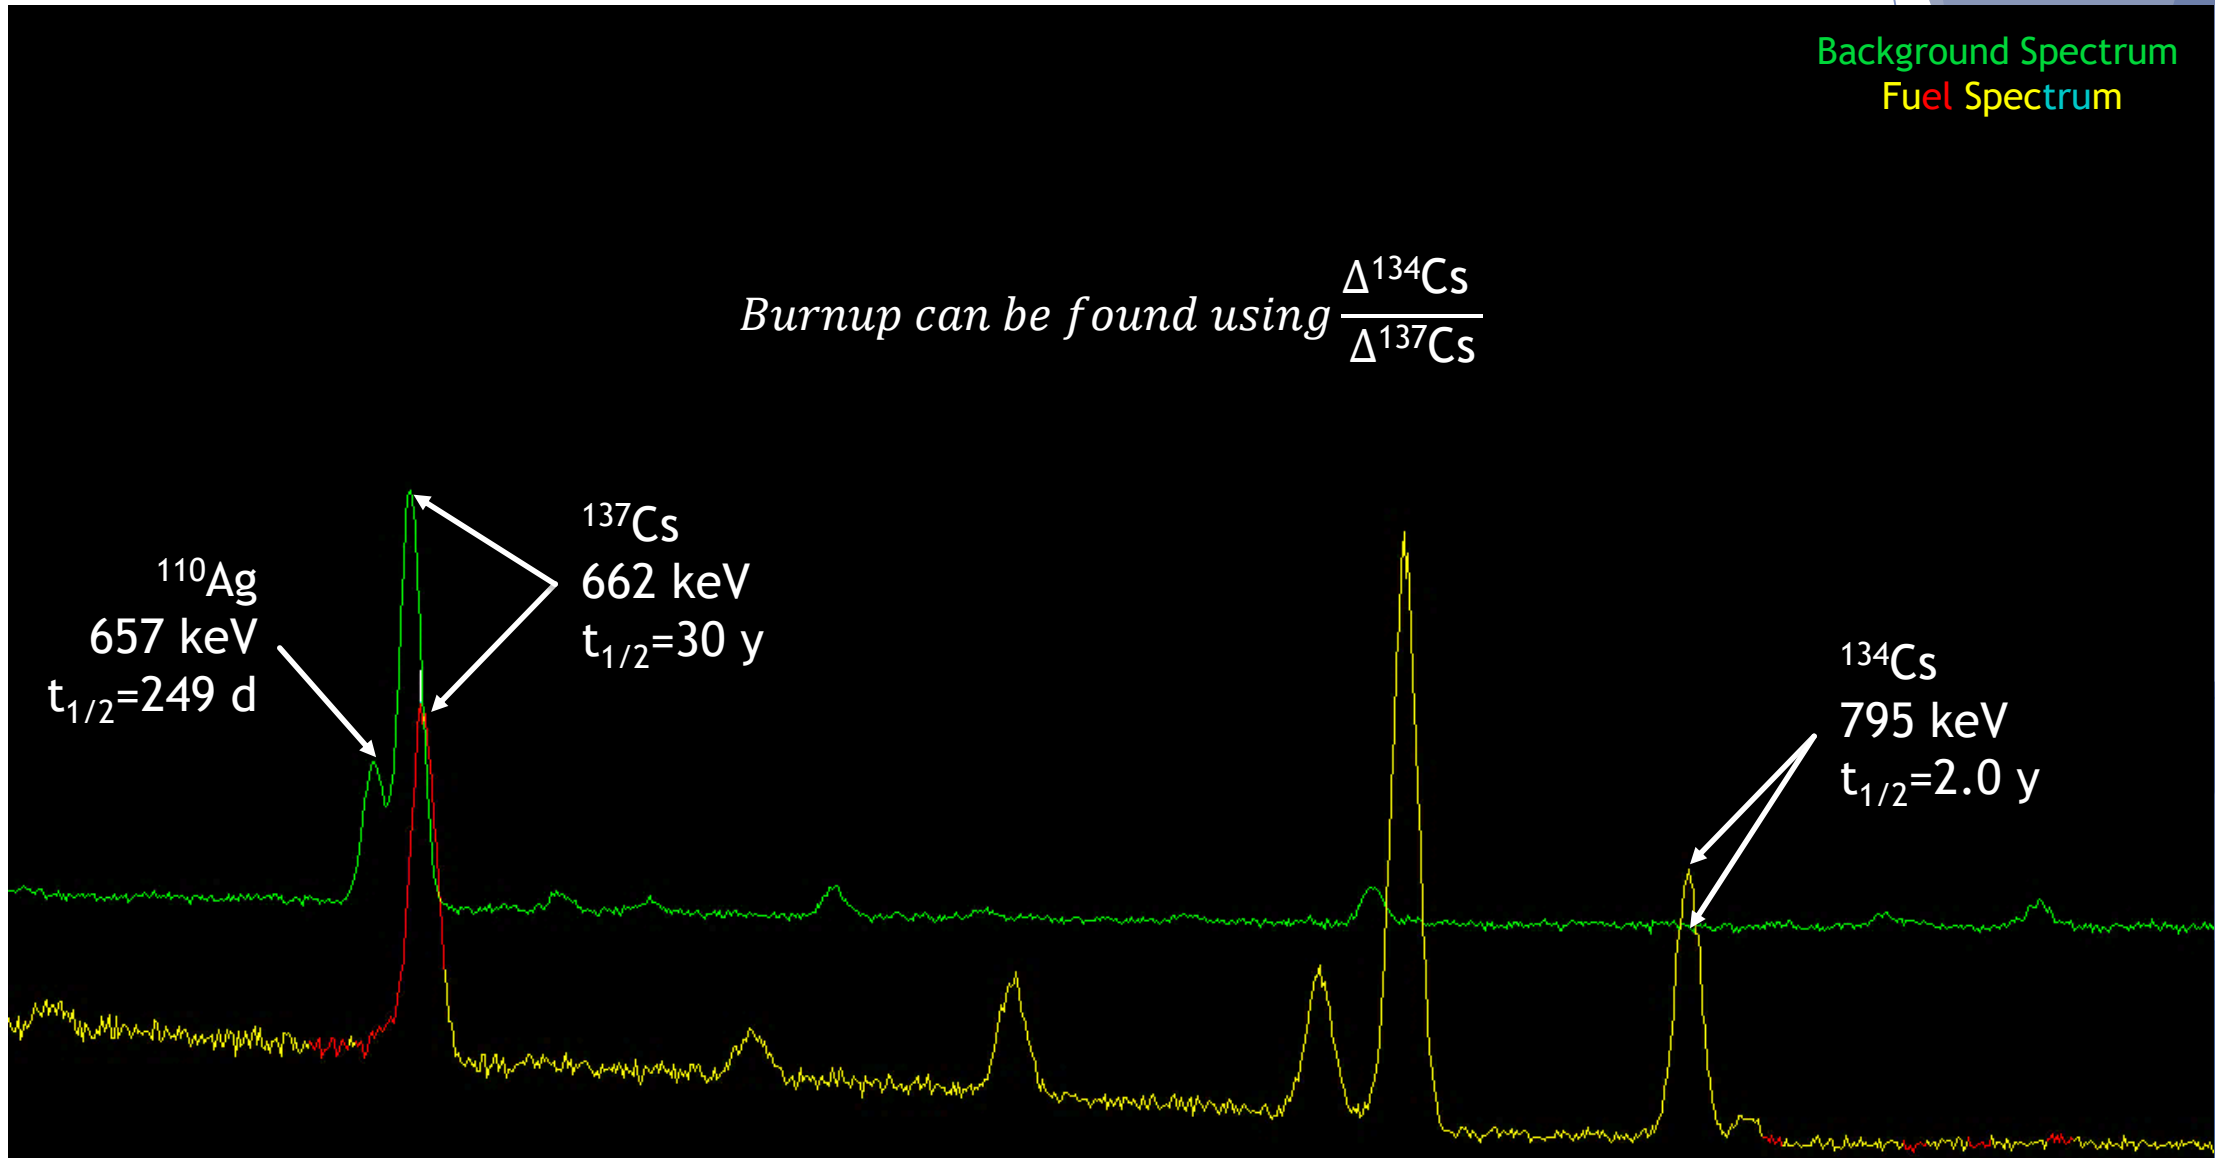

- ▶ Collimator was bending in the water.
- ▶ Background spectrum was not very different from fuel spectrum.
- ▶ Needed a solution

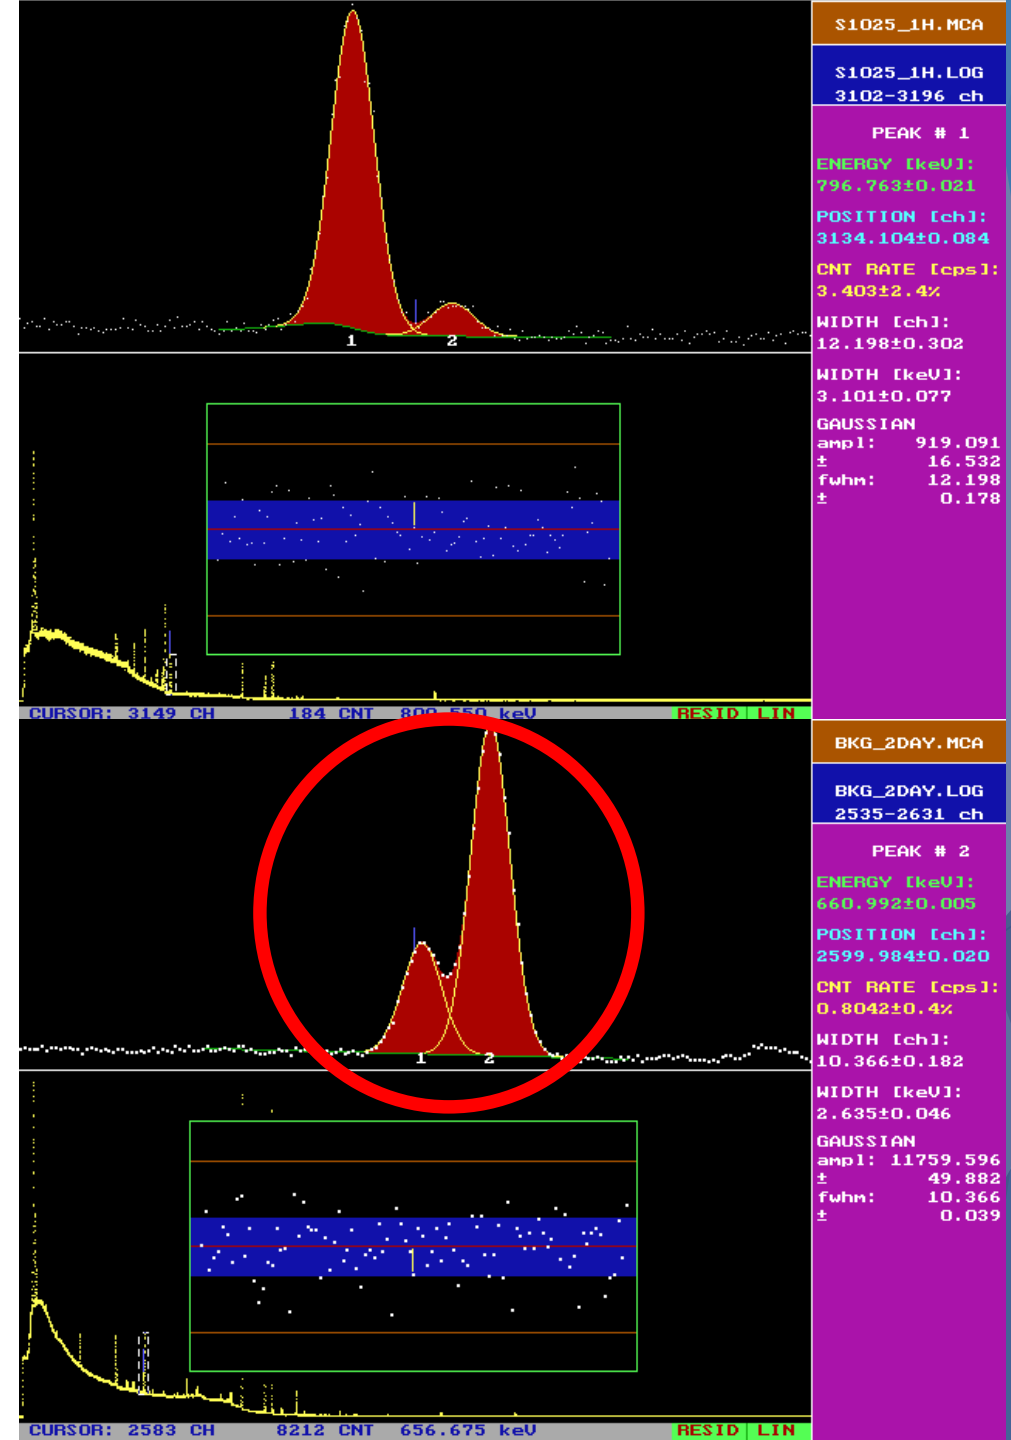

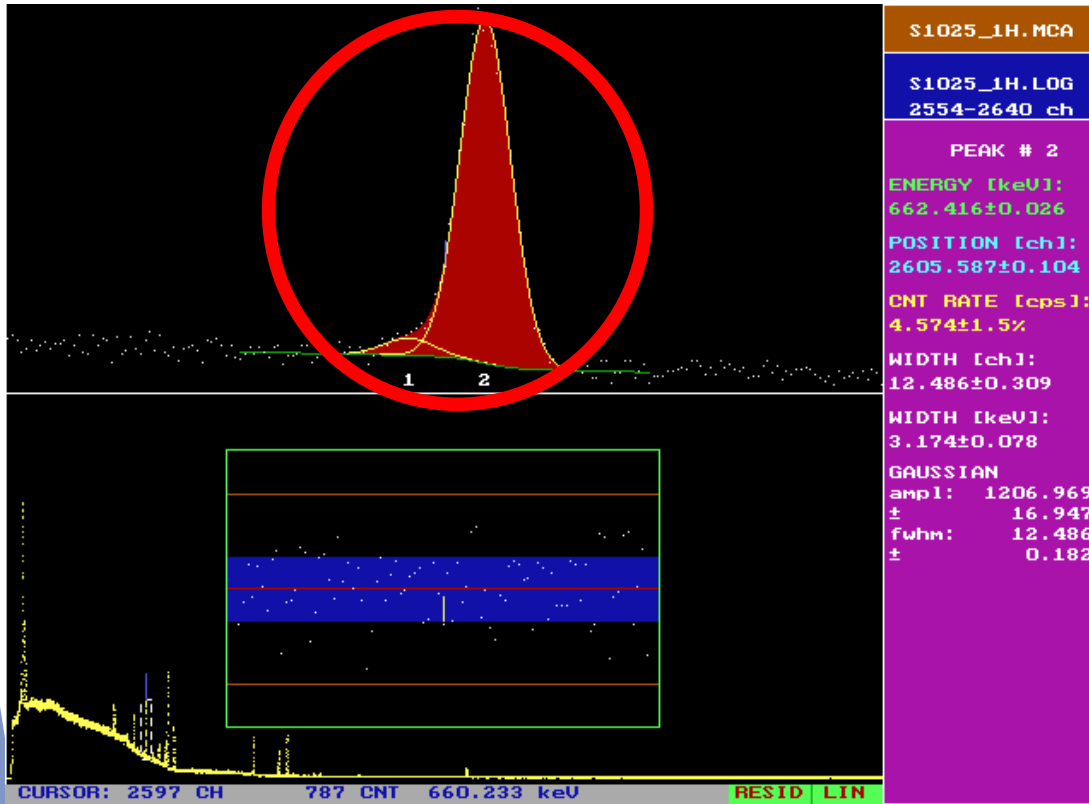

Initial Results

Initial Results

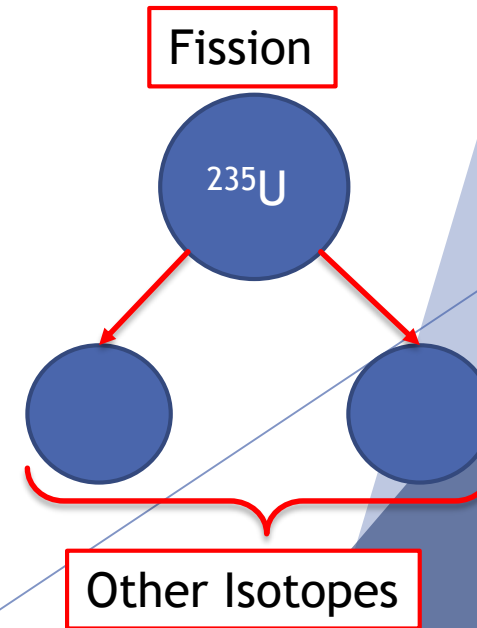

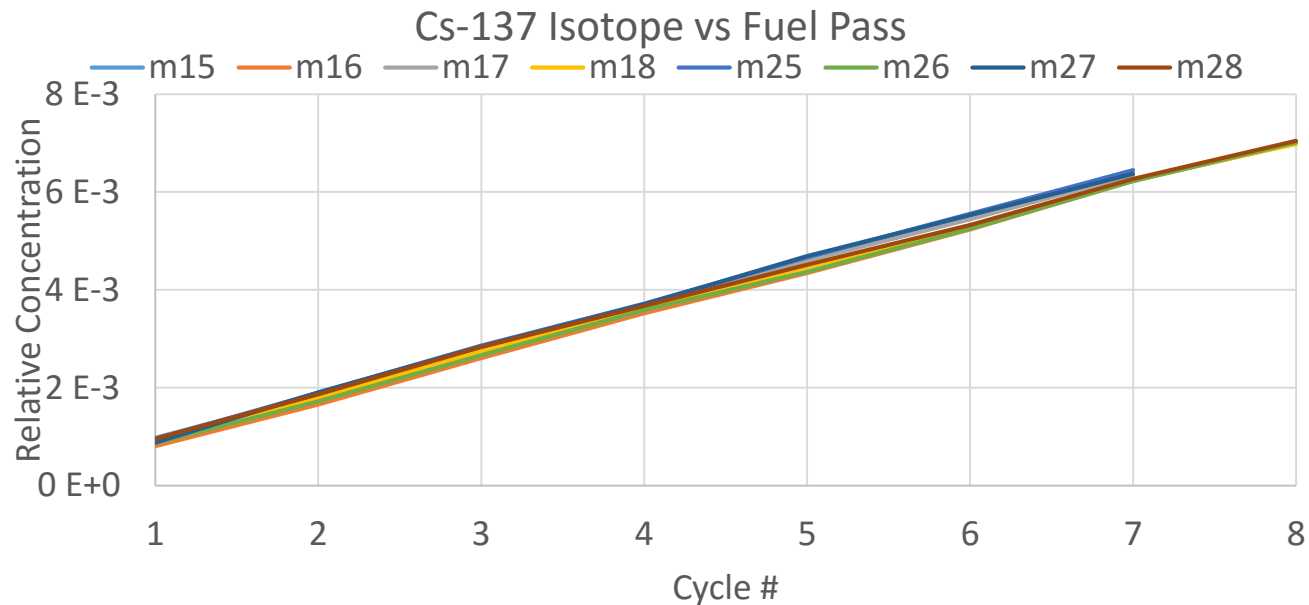

Peak Fitting

- ▶ Peaks were refitted in Hypermet-PC
- ▶ $\frac{\Delta^{134}\text{Cs}}{\Delta^{137}\text{Cs}}$ ratio was calculated with the refitted peaks

Isotope Buildup over fuel life (MCNP)

Experiment efficiency (MCNP)

Burnup of fuel (MCNP depletion study)

BURNUP!!

$$\frac{\Delta^{134}\text{Cs}}{\Delta^{137}\text{Cs}} = \frac{\epsilon_{134}}{\epsilon_{137}} \times \frac{CR_{134}}{CR_{137}} \times \frac{\lambda_{137} I_{662}}{\lambda_{134} I_{795}} \times \frac{e^{\lambda_{134} t_{cool}}}{e^{\lambda_{137} t_{cool}}}$$

Experiment Efficiency Count Rate Specific γ emission rate Cooling Time

Fuel Element	Isotope Ratio	Burnup (MW-day)	Power* (MW)
S1025 (July 2015)	0.0751	5329	19.8
S1036 (Jan 2016)	0.0705	5100	18.9

*38.5 d cycles assumed (7-cycle fuel)

Calculated error due to background corrected gamma peaks area is +/-0.04 MW

Burnup Results

Conclusion

- ▶ Assembled the entire experiment and proved that it works
- ▶ Addressed health physics concerns and completed safety evaluation
- ▶ Observed several isotopes from fuel, and was able to determine burnup
- ▶ **This is the first time this is ever been done**

Future Work

- ▶ Make a collimator that works better
- ▶ Improve stability of apparatus
- ▶ Longer count times (overnight)
- ▶ Measuring additional elements
- ▶ Evolve this experiment into a gamma spectroscopy scanning apparatus

A special thank you to these individuals:

Daniel Mattes

He's a Mechanical Engineer.
It automatically makes him awesome

Timothy Barvitskie

Guided me through μ and TVL calculations (and helped out with Genie...and helped out with other details of the project)

Danyal Turkoglu

Taught me almost everything I know about detectors

Ryan Fangmeyer

HE'S A SURF STUDENT TOO!!

Acknowledgments

My Mentor:

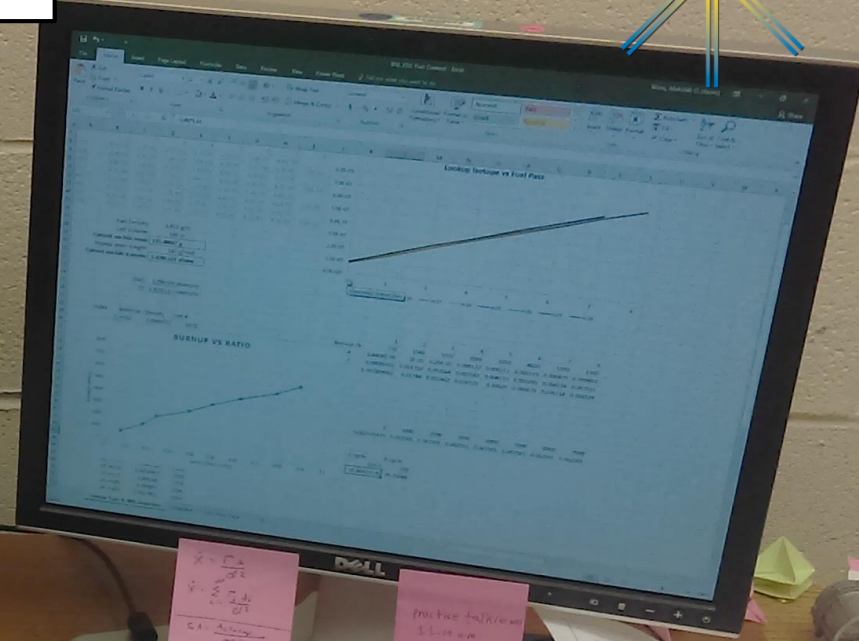

Bryan Evers
