Intersection Summary

HCM 6th Ctrl Delay	29.6
HCM 6th LOS	C

Notes

- User approved pedestrian interval to be less than phase max green.
- User approved volume balancing among the lanes for turning movement.
- Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

Area Type: Other
 Cycle Length: 110
 Actuated Cycle Length: 110
 Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBT, Start of Green
 Natural Cycle: 105
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 1.00
 Intersection Signal Delay: 33.7
 Intersection LOS: C
 Intersection Capacity Utilization 72.6%
 ICU Level of Service C
 Analysis Period (min) 15
 ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

HCM 6th Ctrl Delay	27.7
HCM 6th LOS	C

Notes

- User approved pedestrian interval to be less than phase max green.
- User approved volume balancing among the lanes for turning movement.
- Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

Area Type: Other
 Cycle Length: 110
 Actuated Cycle Length: 110
 Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBT, Start of Green
 Natural Cycle: 105
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 1.04
 Intersection Signal Delay: 37.3
 Intersection LOS: D
 Intersection Capacity Utilization 74.9%
 ICU Level of Service D
 Analysis Period (min) 15
 ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

**K = DHV / AADT

***V = Intersection Peak Volume / K

Crashes for spots (such as intersections) are normally expressed in terms of crashes per million entering vehicles (MEV). Use the following formula:

$$R = (A \times 10^6) / (365 \times T \times V)$$

where,
R = crash rate
A = number of reported crashes
T = time period of the analysis in years
V = daily entering volume at the intersection

Segment Crash Rates

*Source: Idaho AADT ArcGIS map, 2021 volumes

Crashes for roadway segments are normally expressed in terms of crashes per 100 million vehicle-miles (100MVM). Use the following formula:

$$R = (A \times 10^8) / (365 \times T \times V \times L)$$

where,
R = crash rate
A = number of reported crashes
T = time period of the analysis in years
V = AADT
L = Length of the segment in miles

TECHNICAL MEMORANDUM

To: Lee Cooper, Micron

From: John Karnowski, PE, PTOE, AICP (john.karnowski@NV5.com)

cc: Deborah E. Nelson, Givens Pursley, LLP

Date: April 6, 2023

Re: Proposed Micron FAB1 Development, S Federal Way, Boise, ID
Construction Traffic Impact Assessment

At the request of ACHD and the City of Boise, NV5 examined the expected traffic loading during construction of a new fabrication facility surrounding the Micron campus. The assessment relies heavily on the traffic impact study completed for this site (dated November 8, 2022) and accepted by ACHD on November 14, 2022.

Background Information

A new manufacturing facility will be built on land adjacent to the existing Micron R&D campus in southeast Boise, ID. This will include multiple new and refurbished buildings, parking areas, physical plants, and other facilities. The development will include 2,000 new Micron associates plus 750 “sustaining” contractors. The new buildings will be east of Federal Way, north of Memory Lane, and west of Columbia Road. When complete, the campus will have the same points of egress as are there today. Construction will take place through 2025. During construction, traffic will utilize a temporary road, which will come from the extension of Memory Lane.

Site Location and Study Area Map

Construction Traffic Development

Micron’s architectural team developed a massing plan showing the expected number of construction workers needed for various stages of the overall project. The head count correlates to individual automobiles but based on the other similar construction projects, construction workers are often carpooled to the site in multiples of two, three or more people per vehicle. The construction management team will require car and vanpools of workers to limit the need for on-site parking. A conservative estimate, for the purpose of this effort is that the daily auto traffic volume will be about 50% of the headcount though the influence of car/vanpooling is likely to be higher and result in lower vehicular traffic.

Light trucks and heavy trucks are more difficult to estimate. The architectural team completed another similar project in 2021. Data were collected over time and averaged together for snapshot of the type of traffic that can be expected on site. In general, employee trips represented 87% of the daily volume. Light duty trucks (i.e., box trucks, delivery vehicles, etc.) were about 5% of the overall traffic volume. The remaining volume (8%) were heavy vehicles that hauled in equipment, construction materials, and carried out rock, earth, spoils, etc.

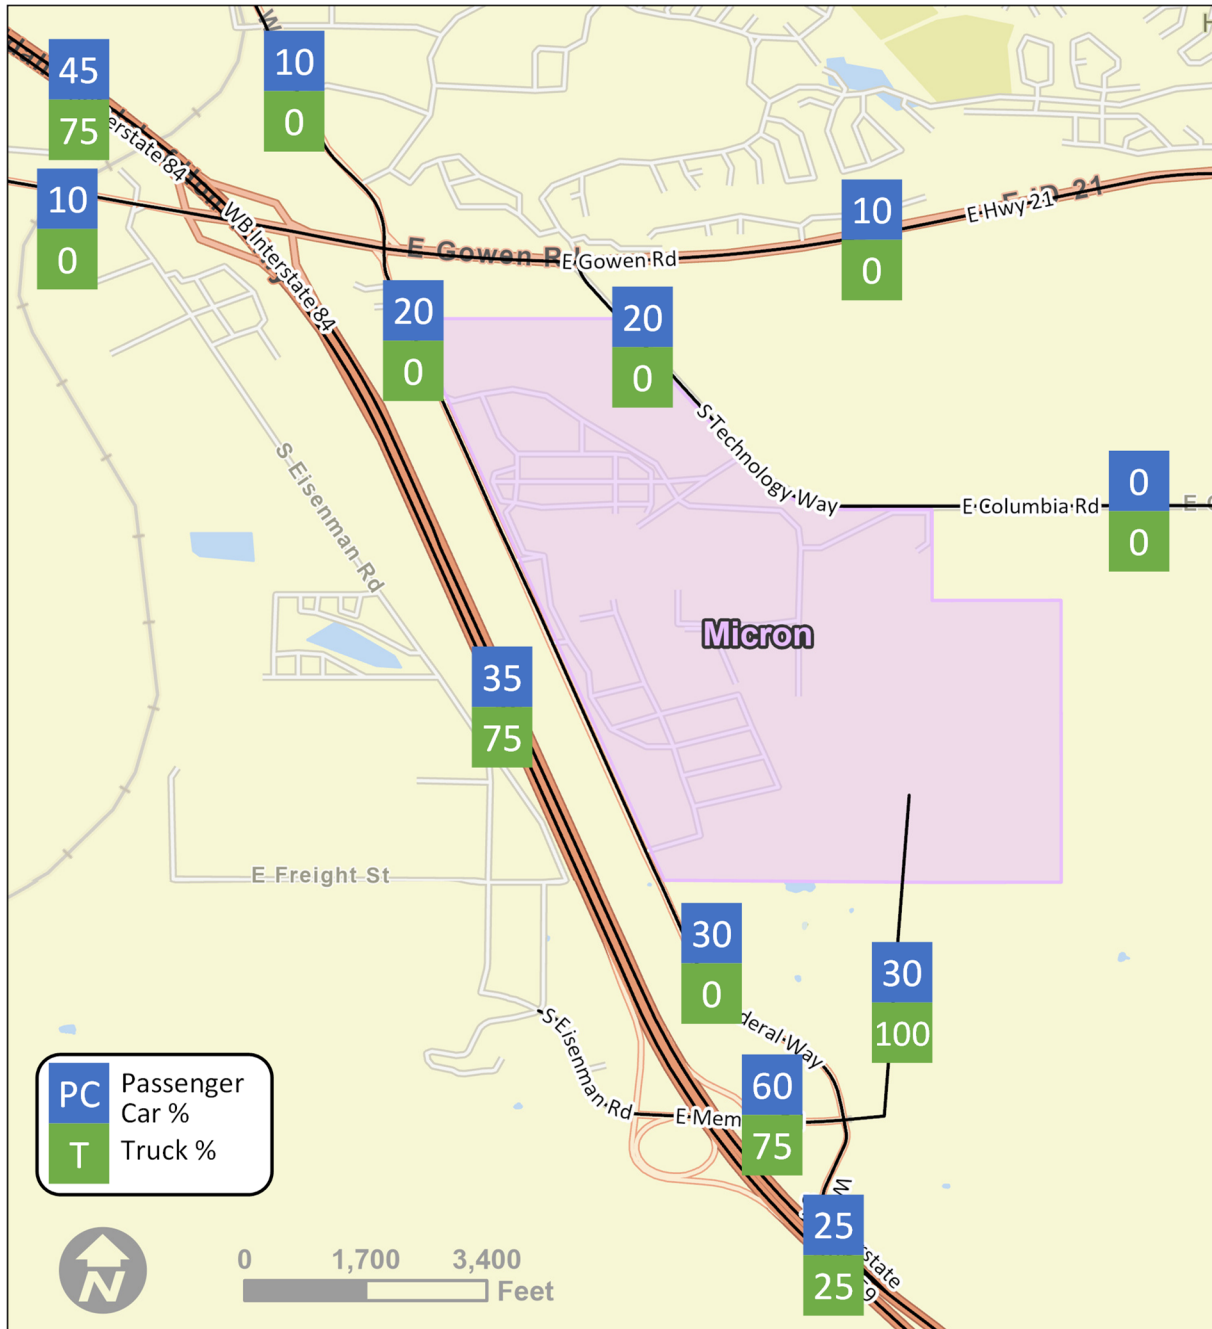

Based on the expected construction schedule, manpower loading, and the ratios of autos, light-duty trucks (LT) and heavy-duty trucks (HV), the following figure was developed to illustrate the ebb and flow of traffic over the course of the construction project. Based on the previous construction project, the peak hour traffic is approximately 21% of the daily volume and comprises a similar ratio of autos, light trucks, and heavy vehicles.

Trip Distribution and Trip Assignment

The anticipated directional distribution is based partially on the distribution assumptions in the Traffic Impact Study and partially on a reassessment of those assumptions with the availability of additional avenues of travel. For example, a new construction roadway will be built to east of the end of Eisenman Pkwy and then due north to the Micron Campus. This roadway is intended to bring trucks and personnel from I-84 and greatly reduce the need to travel along the existing corridors. Moreover, construction equipment (LT and HV) will be restricted from using Technology Way; therefore, the I-84 at Eisenman Pkwy interchange will be the most advantageous path for the construction project. The expected trip distribution is shown in the following figure.

Macro Area Trip Distribution – Autos and Trucks

Using the expected traffic volume for the three vehicle types and the distribution shown above, the volume on each segment of the surrounding road network was developed for each three month period from January 2023 through the end of 2025.

As can be seen by the preceding table, the volume of traffic on each road is the sum of products of daily volume by vehicle type and the distribution expected for that vehicle type. For each three-month period of the year, the traffic volumes were assigned to the road network and illustrated by variable width lines. Those images are shown on the following pages.

Conclusions

At the height of construction in the fourth quarter of 2024, there will be over 4500 auto, light-truck, and heavy vehicles trips per days associated with the new Micron fabrication facilities. Most of the trips will make use of the under-utilized Eisenman Road interchange. Heavy vehicles will be required to use the construction entrance from the eastern extension of Eisenman Road. Personal vehicle trips will be limited by the need to carpool/vanpool to the site due to limitations on parking imposed by Micron and the contractor.

TECHNICAL MEMORANDUM

To: Lee Cooper, Micron

Re: Traffic Impact Study 2030 Horizon Year Analysis
Proposed Micron FAB1 Development, S Federal Way, Boise, ID

A traffic impact study for the Micron FAB1 project was completed and accepted by ACHD November 8, 2022. Subsequently, ITD reviewed the study and requested changes to comply with their standard practices, The study was revised January 18, 2023. As part of the Environmental Assessment for the project, a horizon year analysis of 2030 is required. This memorandum includes additional LOS analysis and mitigation measures for the study intersections identified in the original traffic impact study.

Summary of 2025 Analysis and Recommendations

Per ACHD requirements, any intersection with an overall Volume-to-Capacity ratio (V/C) greater than 0.90 is considered to be substandard. For ITD, intersections on the state highway system that exhibit movements with LOS F or V/C ratios greater than 0.90 are considered insufficient. The following intersections were identified as needing improvements and the subsequent mitigation as shown below:

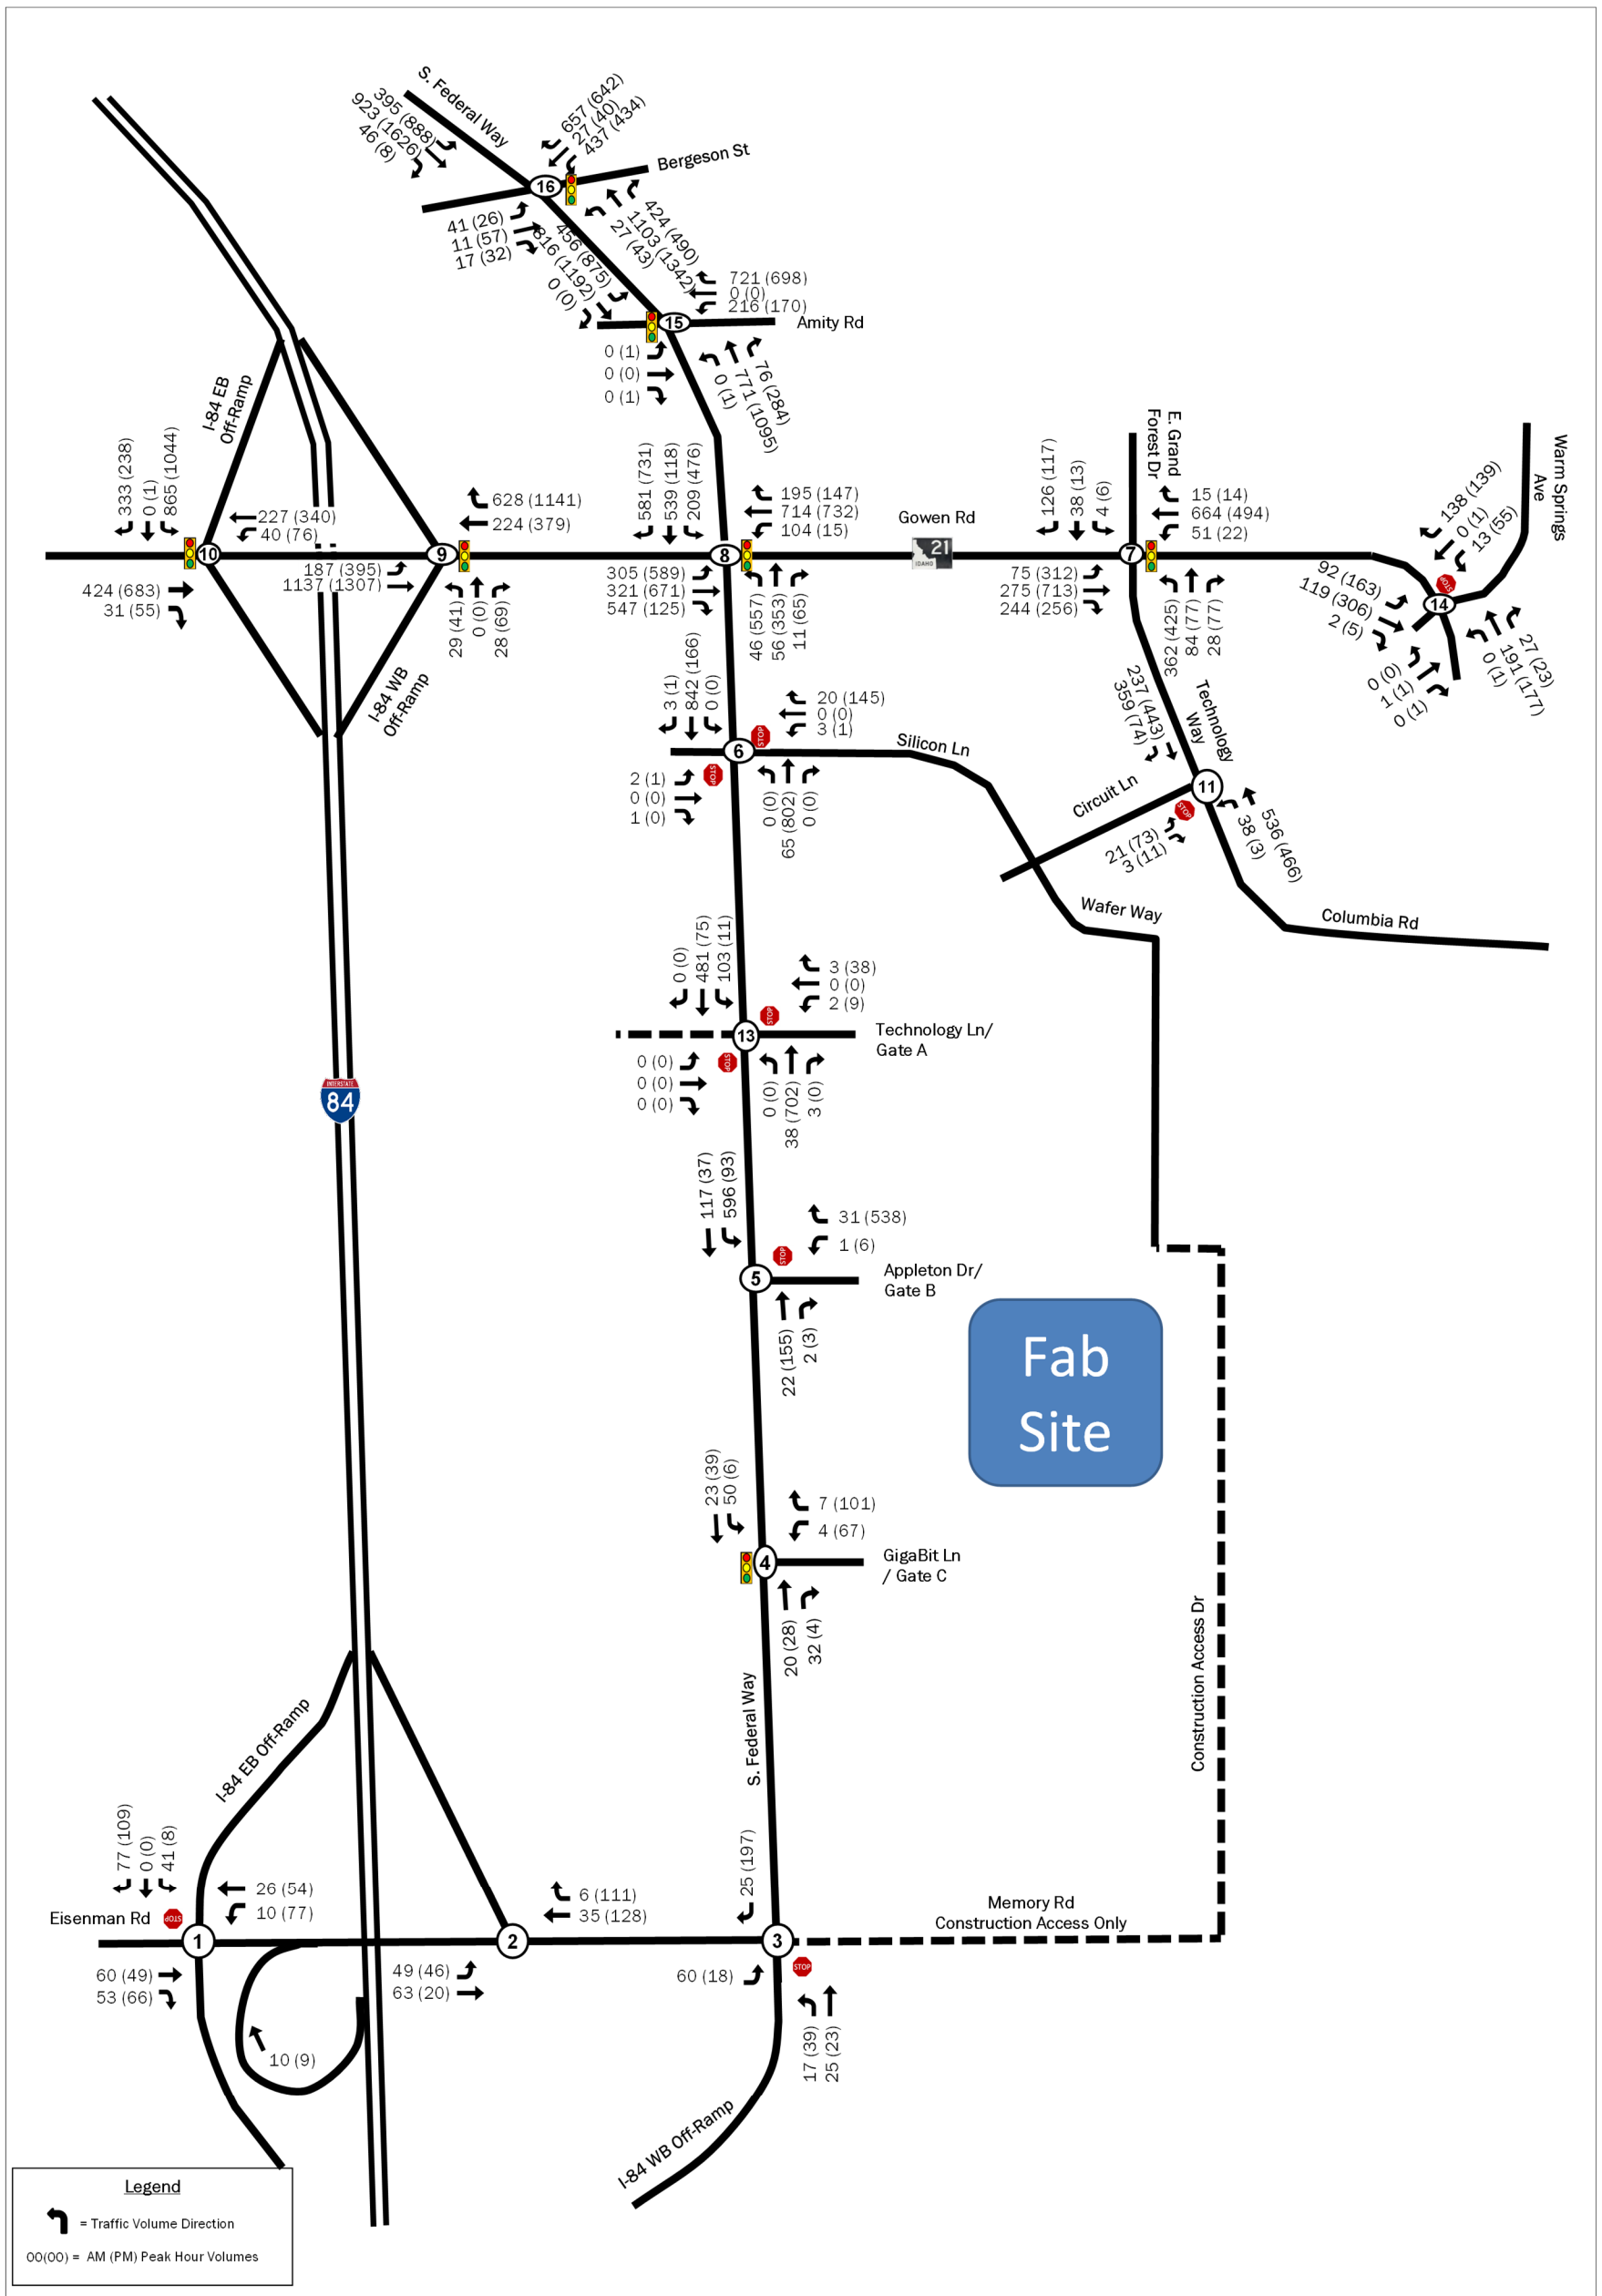

3. Memory Road (Eisenman Pkwy) & Federal Way / I-84 WB Off-Ramp (2025 Build Conditions)
 - Re-configure the southbound approach to the intersection to include a left turn lane
 - Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane
5. Federal Way at Gate B (2025 Build Conditions)
 - Install a traffic signal <or> eliminate left turn movements out of Micron's campus
8. Gowen Road (SH 21) & S Federal Way (2022 Existing Conditions)
 - Add a southbound left turn lane
 - Add a westbound thru lane and replace the westbound right turn lane
 - Re-time traffic signal
10. Gowen Road (SH 21) & I-84 EB Ramp (2022 Existing Conditions)
 - Add a 3rd southbound left turn lane
 - Replace southbound right turn lane
 - Re-time traffic signal
15. Federal Way & Amity Way (2022 Existing Conditions)
 - Add a right-turn overlap signal for the westbound right turns
 - Construct dual southbound left turn lanes
 - Add 1000 foot receiving lane east of the intersection
 - Reconfigure the southbound left turn signal for protected-only operation
 - Reconfigure the northbound left turn signal for permitted operation
 - Remove the split-phased operation and retime signal
16. Federal Way & Bergeson Avenue (2022 Existing Conditions)
 - Add a channelizing island for the westbound right turn movement
 - Add a right-turn overlap signal for the westbound right turn movement
 - Extend the left turn lane on Bergeson to a total of 500 feet

- Change the eastbound left-thru lane to an exclusive left turn lane
- Remove the split-phased operation and re-time the signal

2030 Horizon Year No-Build Analysis

As a part of the initial traffic impact study, COMPASS provided traffic growth projections for the various roadways surrounding the site from 2025 to 2030. The projections were used to grow traffic to a baseline, no-build 2030 volume. Refer to the traffic impact study dated January 18, 2023 for more details on how the growth projections were calculated. Figure 1 shows the 2030 no-build volume at the study intersections.

Figure 1. 2030 No-Build Volume

Using the same analysis methods as in the initial traffic impact study, the intersection levels of service were calculated along with V/C ratios, delay, and queuing. Table 1 shows the results.

Table 1: Intersection Level of Service Results – 2030 No-Build Conditions

Per ACHD and ITD evaluation criteria, the following intersections will be considered substandard and in need of improvements by 2030, irrespective of the FAB1 project.

- 7. Gowen Road (SH 21) at Technology Way/Grand Forest Dr
- 8. Gowen Road (SH 21) at Federal Way
- 10. Gowen Road (SH 21) at I-84 EB Ramp
- 15. Federal Way at Amity Rd
- 16. Federal Way at Bergeson Ave

All these intersections except Gowen Road at Technology Way were previously identified as needing improvement for existing and subsequent analysis scenarios. At that intersection, one option is to force all southbound traffic from Grand Forest Drive to turn right and eliminate a signal phase. Since there is another access to Gowen Road to the west and because the volume is relatively small, this is a possible improvement. Another possible improvement is a multi-lane roundabout. The resulting analyses of the 2030 No-Build volume with the 2022 recommended mitigation (and the aforementioned improvement at Intersection 7) are shown in Table 2.

As can be seen above, Intersections 8, 15, and 16 will experience substandard conditions in 2030 with the proposed improvements and without any additional traffic from FAB1. Additional improvements were tested for each of the three intersections. They include the following:

8. Gowen Road (SH 21) & S Federal Way (2030 No-Build Conditions)

- Add a westbound left turn lane
- Add a second southbound right turn lane
- Re-time traffic signal

15. Federal Way at Amity Rd (2030 No-Build Conditions)

- Add northbound right turn lane
- Re-time traffic signal

16. Federal Way at Bergeson Ave (2030 No-Build Conditions)

- Convert to an R/Cut intersection by removing all side street movements except right turns
- All diverted movements will require a turnaround location north and south of the intersection

2030 Horizon Year Build Analysis

Using the 2030 No-build volume as a base, the new FAB1 traffic was added. In the traffic study, this volume was assumed to be present by 2025. Figure 2 shows the 2030 no-build volume at the study intersections.

Using the same analysis methods as before, and the improvements identified in the traffic study, the intersection levels of service were calculated along with V/C ratios, delay, and queuing. Table 4 shows the results of the 2030 Horizon Year Build analysis.

Per ACHD and ITD evaluation criteria, the same intersections identified previously will be considered substandard and in need of additional improvements by 2030 with the new site volume. In addition, one intersection (5 Federal Way at Gate B) will require improvements even though it does not mean the requirements set forth by ACHD. The recommendation is to either install traffic signal or eliminate left movement out of Micron's campus.

7. Gowen Road (SH 21) & Technology Way (2030 No-Build Conditions)

- Prohibit southbound left and thru movements
 - Channelize southbound right turn movements
- < OR >

- Multi-lane Roundabout

8. Gowen Road (SH 21) & S Federal Way (2030 No-Build Conditions)

- Add a westbound left turn lane
- Add a second southbound right turn lane
- Re-time traffic signal

15. Federal Way at Amity Rd (2030 No-Build Conditions)

- Add a second westbound right turn lane
- Add northbound right turn lane
- Re-time traffic signal

16. Federal Way at Bergeson Ave (2030 No-Build Conditions)

- Convert to an R/Cut intersection by removing all side street movements except right turns
- All diverted movements will require a turnaround location north and south of the intersection

As can be seen above, Intersections 8, 15, and 16 will continue to experience substandard conditions in 2030 with the proposed improvements and with additional traffic from FAB1. Additional improvements were tested for each of the three intersections. They include the following with the resulting LOS shown in Table 6:

- 8. Gowen Road (SH 21) & S Federal Way (2030 No-Build Conditions)
 - Add a westbound left turn lane

- Add a second southbound right turn lane
 - Re-time traffic signal
15. Federal Way at Amity Rd (2030 No-Build Conditions)
- Add a second westbound right turn lane
 - Add northbound right turn lane
 - Re-time traffic signal
16. Federal Way at Bergeson Ave (2030 No-Build Conditions)
- Convert to an R/Cut intersection by removing all side street movements except right turns
 - All diverted movements will require a turnaround location north and south of the intersection

As can be seen by the results on Table 6, the intersections, though measurably better, are still not able to fully meet the standards set forth by ACHD. The mitigation measures to address projected growth in the Federal Way corridor are significant. The FAB1 site will have nominal additional impacts on the traffic. If growth trends continue, Federal Way, north of Gowen Road will need to be a six-lane, divided arterial and the feeder roads (Amity Road and Bergeson Avenue) will need to likewise be widened near Federal Way.

Conclusions

The impact of future traffic growth in 2025 and a traffic from a new fabrication facility on the Micron Campus in southeast Boise was initially assessed in a traffic impact study submitted and reviewed by ACHD in November, 2022 and updated after review by ITD in January 2023. This memo includes assessment of the conditions in the horizon year of the project, 2030.

Table 7 includes a summary of mitigation measures to bring the area intersections into compliance with local guidelines. Or, in the case of two locations, to bring the intersections close to those guidelines. Table 8 shows the new site traffic at each intersection as a percentage of total volume.

Table 7: Intersection Mitigation Summary

ID	Intersection	Mitigation Measures				
		2022 Existing Traffic	2025 Traffic (No-Build)	2025 Traffic with Project	2030 Traffic (No-Build)	2030 Traffic with Project
3	Memory Rd & Federal Way/I-84 WB Off-Ramp	None	None	- Re-configure the southbound approach to the intersection to include a left turn Lane - Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane	No additional improvements	No additional improvements
5	Federal Way at Gate B	None	None	- Install traffic signal < OR > - Eliminate left movement out of Micron's campus	No additional improvements	No additional improvements
7	Gowen Rd at Technology Way/Grand Forest Dr	None	None	None	-Prohibit southbound left and right turns and channelize southbound right turns to a yield condition < OR > -Multi-lane Roundabout	No additional improvements
8	Gowen Rd at Federal Way	- Add southbound left turn lane - Add westbound thru lane - Replace westbound right turn lane - Retime signal	No additional improvements	No additional improvements	- Add westbound left turn lane - Add 2nd southbound right turn lane - Retime signal	No additional improvements
10	Gowen Rd at I-84 EB Ramp	- Add 3rd left turn lane on exit ramp -Replace southbound right turn lane on exit ramp	No additional improvements	No additional improvements	No additional improvements	No additional improvements

Date: May 31, 2023

Re: ITD-Specific Traffic Impact Analysis
Proposed Micron FAB1 Development, S Federal Way, Boise, ID

This memorandum provides ITD with additional analysis and mitigation measures for the intersections and roadways maintained by the State and found to have insufficient conditions. The initial TIS for the project was completed November 8, 2022 and subsequently accepted by ACHD. ITD provided review comments on that version of the report and requested additional analysis for those locations that exhibited less than acceptable conditions and which were not covered by ACHD's guidelines for mitigation. The TIS has been updated per ITD's comments and re-issued with a date of January 18, 2023.

The following intersections on the State Highway system that have or will have movements with LOS F or V/C ratios greater than 0.90 (numbered according to the TIS):

8. Gowen Road (SH 21) & S Federal Way
9. Gowen Road (SH 21) & I-84 WB Ramp
10. Gowen Road (SH 21) & I-84 EB Ramp

These intersections are the subject of this technical memo which is an adjunct to the TIS updated January 18, 2023. Tables 1, 2, and 3 reflect the subject intersection analysis results from the TIS. Those movements with red highlighted results indicate the need for improvement per ITD.

Gowen Road (SH 21) at Federal Way (signal)

The existing problems at the intersection are primarily the left turn movements and are seen during the PM peak hour. The higher volume left turns are the northbound lefts and the eastbound lefts. In the no-build condition (2025 volume without the site), the delay increases for the southbound right as well as the overall signal operations.

The intersection was somewhat recently upgraded to provide safer movements for pedestrians and bicyclists. There are dual left turn lanes in the northbound and the eastbound directions. It is possible to add a southbound left turn lane with minimal construction effort; however, adding a second turn lane would require that the phasing of the signal be changed from protected-permitted to protect-only. The difference in delay is minimal but the queue length would be halved. A second westbound left turn lane is unnecessary.

Because there are three receiving lanes on the west side of the intersection, it is possible to add a westbound through lane. This change, with some small signal timing split adjustments, would allow for LOS D operation on most of the movements but there may be impacts to the bicycle lanes.

Recommendation(s):

- Add a southbound left turn lane by restriping the existing gore area and adding a protected-only signal phase
- Add a westbound thru lane by removing the channelizing island in the northeast corner and restriping
 - Replace the westbound right turn lane
 - The bike lane on the west side of the intersection may have to be eliminated
- Re-time the traffic signal to account for the added capacity
- There appears to be sufficient right-of-way to accomplish the improvements.

See the illustration below for a conceptual layout of the mitigation recommendation.

Mitigation Concept Plan

SBR	255	0.64	A	7.1	116	0.93	D	36.9	536			

Gowen Road (SH 21) at I-84 WB Ramp (signal)

The only poor operations (i.e., LOS E) at this intersection are the northbound left and right turn movements coming off of the ramp. The volumes are low but the PM peak hour has somewhat long delays. The longer delays cause a small number of vehicles have to wait a long time between green cycles. Adjusting the signal timing does little to reduce the average delay because the low volume arrival rate means that each vehicle will have to wait nearly a full cycle before proceeding. The queues are not long and there is plenty of capacity to handle more traffic. No improvements are recommended.

Gowen Road (SH 21) at I-84 EB Ramp (signal)

The left turning traffic volume on the exit ramp is high, Traffic can often back up 600-800 feet on the ramp. This is concerning because the ramp is only 750 feet long and I-84 is an 80 MPH freeway, which requires more space for deceleration. More distance is needed to accommodate the queue and avoid impacting I-84.

The signal timing cycle length is 190 seconds in the AM and 220 seconds in the PM. This time is likely intended to clear the ramp so that it does not impede the I-84 mainline. However, a cycle length of this magnitude results in a long time between service intervals and contributes to a poor level of service. By contrast, a more reasonable 130 or 150 second cycle length would result in better LOS and provide more service intervals for the heavy ramp traffic.

It is possible to add a third left turn lane but that would improve the LOS with changes in timing. It would allow for more storage space and a more reasonable cycle length. However there is a loss of efficiency for each turn lane added – limiting the benefits of an additional lane. Building the additional space on the ramp will require both ITD and FHWA approval.

Another alternative is to add an additional thru lane in the westbound direction. This would provide more capacity for SH 21 and allow more green time for the ramp.

Recommendation(s):

- Retime the traffic signal to a more reasonable lower cycle-length
- Add a westbound through lane approximately 300 feet long that drops into S. Eisenman Road

- Rebuild the traffic signal as needed

See the illustration below Table 5 for a conceptual layout of the mitigation recommendation.

Intersection Summary

Area Type: Other
 Cycle Length: 90
 Actuated Cycle Length: 90
 Offset: 88 (98%), Referenced to phase 2:WBT and 6:EBT, Start of Green
 Natural Cycle: 85
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 1.01
 Intersection Signal Delay: 36.7 Intersection LOS: D
 Intersection Capacity Utilization 70.0% ICU Level of Service C
 Analysis Period (min) 15
 ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

DISTRICT 3 OPERATIONAL PROCEDURES

DATE: November 13, 2020

SUBJECT: **DEVELOPMENT PROPORTIONATE SHARE CONTRIBUTION**

FOR SPECIAL ATTENTION OF: DISTRICT 3 EMPLOYEES

DATE OF REVIEW:

The Idaho Transportation Department’s (ITD) responsibility is to ensure each State highway properly addresses safety and mobility. New development growth, both on and off the State highway system, contributes to increased congestion. District 3 has defined an equitable program for improving public facilities needed to serve new growth and development and to protect the public safety of the citizens of the state of Idaho.

Area of Interest

Application of the program will be generally applied to any development within a five (5) mile connection to the State highway system. Depending on the size of the development and available connectivity to the State highway system, District 3 may request information regarding developments beyond the prescribed five mile connection distance.

Analysis Requirements

A Traffic Impact Study (TIS) is required by *Idaho Administrative Code (IDAPA) 39.03.42* for any new or expanded development that at full buildout meets or exceeds any of the below described thresholds and is requesting a direct connection to the State highway system. District 3 will apply these same TIS requirement thresholds to any development within the above described area of interest.

- Generates 100 or more peak hour trips; or
- Meets or exceeds the following land use threshold values; or

LAND USE TYPE	THRESHOLD VALUE
Residential	100 Dwelling Units
Retail	35,000 square feet
Office	50,000 square feet
Industrial	70,000 square feet
Lodging	100 rooms
School (K-12)	All (Sections 67-6508 & 67-6519, Idaho Code)

- Connects to a public road / State highway intersection with known safety, capacity and/or congestion concerns.

Developments not meeting any of the above thresholds at full buildout will be asked to provide some or all of the following data and analysis.

- Trip generation numbers
- Trip Distribution Percentage Diagram (request from COMPASS if in Ada or Canyon County)
- Intersection site traffic turning volumes
- Left and right turn lane warrants
- Vehicle turning movement diagrams

State Highway System Mitigation Improvements

Intersection mitigation improvements are required for any individual movement exceeding LOS F or volume to capacity ratio (v/c) of 0.9 or greater. Roadway mitigation improvements are required for any roadway segment analysis exceeding LOS E.

Left and right turn lanes will be required at any non-signalized intersection meeting the ITD Traffic Manual's Left and Right Turn Lane Warrants.

For developments on or near corridors **with** ITD approved corridor plans:

- 1.) When a development meets or exceeds the TIS thresholds described under *Analysis Requirements* the development is required to provide a TIS.
 - a. TIS shall identify any mitigation improvements at public road intersections.
Proportionate share contributions shall be calculated at public road intersections requiring mitigation improvements.
 - b. TIS shall identify any specific improvements required for direct access approaches (new or existing) to the State highway system.
- 2.) For all developments defined within ITD's area of interest, but do not meet or exceed the TIS thresholds:
 - a. ITD will identify the development's area of impact on the State highway system.
 - b. The development will provide at a minimum:
 - Trip Generation Summary Table
 - Trip Distribution Patterns
 - Total Traffic Volume Diagrams
 - c. Based on the provided information, ITD will calculate the development's proportionate share contribution for future identified improvements per the associated corridor plan.

For developments on or near corridors **without** ITD approved corridor plans:

- 1.) When a development meets or exceeds the TIS thresholds described under *Analysis Requirements* the development is required to provide a TIS.
 - a. TIS shall identify any mitigation improvements at public road intersections. Proportionate share contributions shall be calculated at public road intersections requiring mitigation improvements.
 - b. TIS shall identify any specific improvements required for direct access approaches (new or existing) to the State highway system.

- 2.) For all developments defined within ITD’s area of interest, but do not meet or exceed the TIS thresholds.
 - a. ITD will identify the development’s area of impact on the State highway system and may request the development to provide:
 - Left and right turn lane warrants
 - Vehicle turning movement diagrams
 - b. Based on the provided information ITD will calculate the development’s proportionate share contribution for identified mitigation improvements.

Projects programmed in accordance with an intergovernmental ITD/Agency agreement may collect proportionate share to fund the joint project. Otherwise, proportionate share contributions cannot include any improvements currently funded/programmed by ITD.

Mitigation Improvement Location	Development Contribution
Private approaches, private roads and new public road connections to the State highway system.	Design and construct 100% of the improvements.
Existing public road / State highway intersections; State highway road segments.	Pay a proportionate share of the mitigation improvement cost. If ITD determines the development impact results in an immediate safety concern, the developer is responsible to design and construct 100% of the mitigation improvement. ITD will work with the development to determine low cost interim solutions where feasible.

Proportionate shares contributions will either be paid directly to ITD or held in an intergovernmental agreement between ITD and the local land use agency for application to a future project. ITD may require the developer to construct a mitigation improvement(s) in lieu of holding the financial contribution, if the proportionate share can fully cover the design/construction cost.

Determination of Proportionate Share Percentage

1.) Intersections/Roadways covered by a District 3 Planning Document

Proportionate share shall be calculated by comparing the number of site trips through an intersection/roadway segment at full build out with the total number of trips forecasted when the improvement is warranted.

Example: Development impacts the intersection of Fisher Parkway and SH-44. ITD has identified that signalization of Fisher Parkway is warranted by 2045.

2045 Fisher Parkway (AM)
SH-44 = 3,934
Fisher Parkway = 284

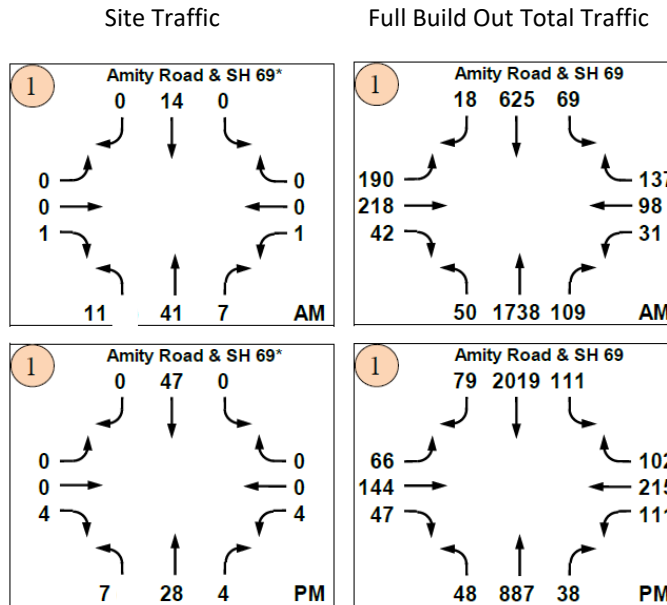

2045 Fisher Parkway (PM)
SH-44 = 4,414
Fisher Parkway = 497

AM Site = 135	AM Total = 4,218	AM % = 3.20
PM Site = 86	PM Total = 4,911	PM % = 1.75
Proportionate Share for Fisher Parkway Signal		Avg % = 2.48

2.) Intersections/Roadways not covered by a District 3 Planning Document

Proportionate share shall be calculated by comparing the number of site trips through an intersection at full build out with the forecasted total number of trips at full buildout.

Example: Development impacts the intersection of Amity Road and SH-69. TIS states widening on SH-69 is needed.

AM Site = 75	AM Total = 3,325	AM % = 2.26
PM Site = 94	PM Total = 3,867	PM % = 2.43
Proportionate Share for SH-69 Widening thru Amity Rd Intersection		Avg % = 2.34

Determination of Proportionate Share Contribution Cost Estimate

ITD shall provide a conceptual cost estimate for any proportionate share mitigation improvements. The conceptual cost estimate will be based on conservative assumptions for roadway base depth. Conceptual cost estimate will include estimated right-of-way (R/W) costs, if additional R/W is required to construct the improvement, ITD is willing to adjust cost estimate based on actual surveyed data if provided by the developer. See Appendix A for conceptual cost estimate unit prices.

The developer’s proportionate share percentage shall be multiplied by the conceptual improvement cost to calculate the development’s proportionate share contribution.

Proportionate share contributions shall either be required in full prior to occupancy of any structures or at a pro-rated amount per each unit if residential, or per square footage of commercial development. Proportionate shares costs shall be held either within an Intergovernmental ITD/Agency agreement or by ITD as defined in the section below.

Intergovernmental ITD/Agency Agreement

Per *Idaho Statute 67-8204A*, the legislature finds that governmental entities are authorized to enter into agreements with the ITD for system improvements. ITD shall establish jurisdiction-wide intergovernmental agreements to hold development proportionate share contributions. ITD and the partnering agency will jointly identify future projects to be funded from the development contributions.

For agencies that will not enter into an interagency agreement, ITD will utilize available financial mechanisms to hold development contributions internal to ITD. Development contribution funds shall be used within 10 years of receipt; otherwise shall be returned to the developer.

This Memo on Development Proportionate Share Contribution is applicable until amended or superseded by new ITD policy. Proportionate share contributions are not an impact fee, they are costs associated to mitigate for development impacts to the State highway system.

J. CALEB LAKEY, P.E.

District 3 Administrator

TRAFFIC IMPACT STUDY FOR

FAB1 MANUFACTURING FACILITY

DATE:

October 17, 2022

LOCATION:

Boise, ID

PREPARED FOR:

Micron

PREPARED BY:

NV5
690 S. Industry Way, Suite 10
Meridian, ID 83642

EXECUTIVE SUMMARY

A new advanced memory fabrication facility, called FAB1, will be located on the Micron R&D campus along S. Federal Way in Boise, ID. FAB1 includes several buildings. The primary structure will be a manufacturing facility that includes an approximately 600,000 square foot “clean” room plus support spaces. To support the Fab, there will be utility buildings, administration buildings, and a vendor/contractor support facility along with parking structures and surface lots.

The following study scenarios were included:

- Existing (2022) Traffic Volume and Roadway Conditions
- Existing + Background Growth (2025) with Existing Roadway Conditions
- Existing + Background (2025) + Project Build with Existing Roadway Conditions

FAB1 will include 2,750 employees of Micron and onsite vendors and, for the purposes of estimating number of trips, is considered a manufacturing land use. The new development will produce 6,174 trips per day with 11% occurring between 7:00 and 8:00 am and 10% occurring between 4:00 and 5:00 pm.

The traffic impact study was conducted in accordance with the approved scoping memorandum and the ACHD Policy Manual. The study network included 12 intersections and four (4) road segments. New traffic counts were collected to set a baseline for the analysis. Traffic growth was estimated using COMPASS’s model output. The expected distribution of auto traffic is approximately 25% to the south via I-84, 10% to the east on SH 21, 10% to the west on Gowen Road and the remaining 55% to the north and west via either Federal Way or I-84. FAB1’s parking lots will be close to the existing Gate C (aka Gigabit Lane). The intersection of Gigabit Lane and S Federal Way will be the primary employee access for the site. Secondary access and parking for utility areas is located on the north side of the campus. Construction traffic will access the site via an extension of Memory Lane Rd and the Eisenman exit from I-84. All roads internal to the Micron campus are private roads.

For the **existing traffic conditions**, five intersections were found to have capacity deficiencies.

- Gowen Rd at Technology Way/Grand Forest Drive
The side streets movements have excessive delays and have a level of service of E. The recommended mitigation includes:
 - Signal timing and phasing changes
- Gowen Rd at S Federal Way
The southbound, northbound, and westbound left turn lanes have high delays in the PM peak hour. The following mitigation is recommended:
 - Add southbound left turn lane by restriping the existing gore area and adding a

protected-only signal phase

- Add a westbound thru lane by removing the channelizing island in the northeast corner and restriping
- There appears to be sufficient right-of-way to accomplish the improvements
- Gowen Rd at I-84 EB Ramp

The ramp traffic will frequently queue to near the I-84 mainline lanes. To avoid impacts to the I-84 traffic, the following improvements are recommended:

 - Add third left turn lane on the exit ramp
 - Re-time the traffic signal to account for the added road capacity
 - There appears to be sufficient right-of-way to accomplish the improvements
- Federal Way at Amity Road

The typical commute pattern includes a heavy westbound right turn in the morning and a heavy southbound left turn in the evening. The high volume of traffic results in a level of service F in both the AM and PM for the westbound right and a level of service E in the PM for the southbound left. The recommended improvements include:

 - Convert the westbound dual right turns lanes into a single free-flow right turn lane
 - Add 1000 foot receiving lane north of the intersection
 - Construct dual southbound left turn lanes
 - Add 1000 foot receiving lane east of the intersection
 - Reconfigure the left turn traffic signal for protected-only operation
 - Re-time the traffic signal to account for the added road capacity
 - There not appear to be sufficient right-of-way to accomplish the improvements
- Federal Way at Bergeson Avenue

Similar commute patterns as Amity Road exist along Bergeson Avenue. The westbound right turn volume is high. There is a short acceleration lane but it does not allow for a free-flow movement and therefore long delays for right turning vehicles heading toward Boise. That movement experiences a level of service F in the both the morning and evening peak hours. While there is a delay for the southbound left turn (LOS E), the recommended improvements, combined with the necessary signal re-timing, will bring the intersection to acceptable levels of service.

 - Channelize the westbound right turn lane into a free-flow right turn lane
 - Add 1000 feet receiving lane north of the intersection
 - Re-time the traffic signal to account for the added road capacity
 - There does not appear to be sufficient right-of-way to accomplish the improvements

When general growth in traffic volume is added to the existing conditions (i.e., **background growth**), the aforementioned conditions will worsen but no additional intersections will be negatively impacted. One intersection will become congested enough that additional mitigation at this intersection may be necessary.

- Gowen Rd at Technology Way/Grand Forest Drive
The intersection delay will be high enough that signal timing will no longer be sufficient. The following is recommended.
 - Construct a multi-lane roundabout to provide enough capacity to accommodate the background traffic as well as the new site traffic.
 - There is not sufficient right-of-way to accomplish the improvements.
 - The right of way and the construction would be the responsibility of ITD.

For the **build-out** of the site, the new traffic will negatively impact the unsignalized Gate B at S Federal Way intersection. While a traffic signal is not likely to be warranted with the new traffic, the delays for the left turning traffic leaving the Micron campus will be high. The following is recommended:

- Install traffic signal
- < OR >
- Eliminate left turns leaving Micron's Campus

Memory Lane will be extended to the east through a temporary easement to provide construction access to the site. A detailed analysis of construction traffic is not a part of this study. However, since the road does not currently exist, the intersection with S Federal Way will need to be modified. The following is the recommended configuration to accommodate the construction traffic:

- Re-configure the southbound approach to the intersection to include a left turn lane
 - Restripe the existing flush median
- Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane

The recommendations for mitigation to the impacts identified above are summarized in the table that follows. In general, the impacts from the site are manageable by the roadway network. S Federal Way is primarily utilized by Micron's current operations with a few additional businesses nearby. The four-lane road has capacity to spare and can accommodate the additional load from FAB1. Similarly, the interchange of Eisenman Road and I-84 is underutilized and, based on the proximity of FAB1, should be the primary access point of choice for employees, delivery vehicles, and contractors.

Intersection Mitigation Summary

Int	Intersection	Control	Recommended Improvements		
			2022 Existing Traffic	2025 Traffic (No-Build)	2025 Traffic with Project
3	Memory Ln & Federal Way/I-84 WB Off-Ramp	Side Street Stop	None	None	- Re-configure the southbound approach to the intersection to include a left turn lane - Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane
5	Federal Way at Gate B	Side Street Stop	None	None	Install traffic signal < OR > Eliminate left movement out of Micron's campus
7	Gowen Rd at Technology Way/Grand Forest Dr	Signal	Signal timing and phasing changes	Construct a multi-lane roundabout with EB and SB by-pass lanes	No additional improvements
8	Gowen Rd at Federal Way	Signal	- Add southbound left turn lane by restriping the existing gore area and adding a protected-only signal phase - Add a westbound thru lane by removing the channelizing island in the northeast corner and restriping - Re-time the traffic signal to account for the added road capacity	No additional improvements	No additional improvements
10	Gowen Rd at I-84 EB Ramp	Signal	- Add third left turn lane on the exit ramp - Re-time the traffic signal to account for the added road capacity	No additional improvements	No additional improvements
15	Federal Way at Amity Rd	Signal	- Convert the westbound dual right turns lanes into a single free-flow right turn lane - Add 1000 foot receiving lane north of the intersection - Construct dual southbound left turn lanes - Add 1000 foot receiving lane east of the intersection - Reconfigure the left turn traffic signal for protected-only operation	No additional improvements	No additional improvements
16	Federal Way at Bergeson Ave	Signal	- Channelize the westbound right turn lane into a free-flow right turn lane - Add 1000 foot receiving lane north of the intersection - Re-time the traffic signal to account for the added road capacity	No additional improvements	No additional improvements

Proposed Development

The Micron R&D facility located along S. Federal Way in Boise, ID will be the site of a new Fab (a an advanced memory fabrication facility). The facility, called FAB1, will utilize both undeveloped and developed area within Micron's larger campus. In conjunction with FAB1, a new childcare facility will be constructed along S. Federal Way, opposite Gate A. The childcare facility is not part of this study but is considered in the future build traffic volume and analysis. A separate, limited traffic study was conducted for the childcare facility.

FAB1 includes several buildings. The primary structure will be a manufacturing facility that includes an approximately 600,000 square foot "clean" room plus support spaces. To support the Fab, there will be utility buildings, administration buildings, and a vendor/contractor support facility along with parking structures and surface lots. FAB1 will support approximately 2000 new Micron employees plus 750 new onsite vendor/contractor employees. For the purposes of this study, the entire FAB1 development will be considered a manufacturing facility with 2,750 employees.

FAB1 is expected to commence limited operation in the end of the second quarter of 2024, and be fully operational with the full complement of employees by 2025.

The following intersections and road segments (as illustrated in Figure 1) are included in this study:

- Intersections
 1. Eisenman Rd & I-84 EB Ramp
 2. Eisenman Rd & I-84 WB On-Ramp
 3. Memory Ln & S Federal Way/I-84 WB Off-Ramp
 4. S Federal Way & Gate C / Gigabit Ln (signal)
 5. S Federal Way & Gate B
 6. S Federal Way & Silicon Way
 7. Gowen Road & Technology Way (signal)
 8. Gowen Road & S Federal Way (signal)
 9. Gowen Road & I-84 WB Ramp (signal)
 10. Gowen Road & I-85 EB Ramp (signal)
 11. Technology Ln & Circuit Way
 12. ~~Memory Ln & Construction Access Road~~ (not studied)
 13. S Federal Way & Gate A / Childcare Center
 14. Gowen Road & Warm Springs Ave
 15. Federal Way & Amity Rd (signal)
 16. Federal Way and Bergeson St (signal)

- Segments
 - A. S Federal Way, South of Silicon Way
 - B. Gowen Road, Btwn S Federal Way and Technology Way
 - C. Memory Lane, Btwn I-84 WB On-Ramp and Federal Way
 - D. Technology Way, Btwn Gowen Road and Circuit Way

Figure 1 shows the general location of the Fab on Micron's campus. The site plan is shown in Figure 2.

Figure 2. Site Plan

***See Appendix A for a more detailed site plan

Existing Conditions

A.1. Transportation Facilities

A.1.1. Roadways

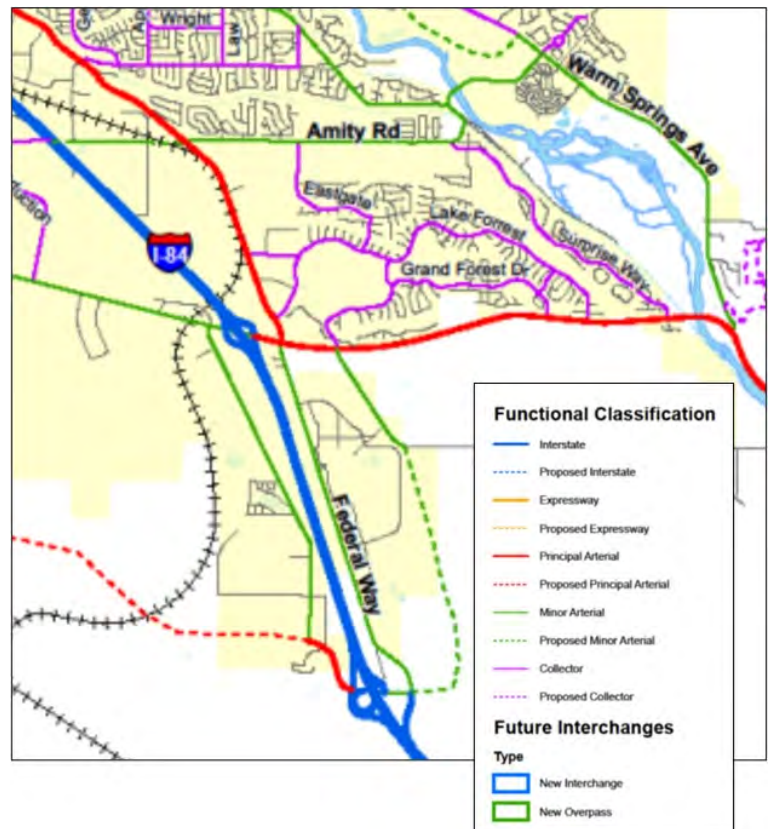

S. FEDERAL WAY is a four-lane arterial with a posted speed limit that varies between 35 and 45 MPH within the vicinity of the study area. The section of S. Federal Way that is south of Gate B is a two-lane divided roadway, and the section between Gate B and Technology Lane has a center two-way left-turn lane. S. Federal Way originates as the north leg of its intersection with Memory Lane and the I-84 westbound exit ramp, and heads in a primarily northerly direction, before ending at US 20/26.

The speed limit of S. Federal Way changes to 40 MPH north of its intersection with E. Gowen Road. S. Federal Way is classified as a Minor Arterial roadway south of its intersection with E. Gowen Road. To the north, it is classified as a Principal Arterial roadway. Land uses within the study area are primarily industrial, with residential and commercial uses north of E. Gowen Road.

E. GOWEN ROAD (SH 21) is a four-lane undivided principal arterial with a posted speed limit of 35 MPH near the Micron Campus. The roadway narrows to a two-lane roadway east of its intersection with Technology Way / Grand Forest Drive and the speed limit eventually increases to 55 MPH. Land uses in the study area are industrial, commercial, residential, and undeveloped.

MEMORY LANE / EISENMAN ROAD is a four-lane undivided Minor Arterial and has a posted speed limit of 35 MPH. Memory Lane originates as the west leg of the intersection with S. Federal Way and the I-84 westbound exit ramp and runs west to its intersection with the I-84 westbound ramp where it becomes S. Eisenman Road. There are no developed uses along Memory Lane but there is a new convenience store at the corner in the northwest corner of Eisenman Road and the I-84 EB off ramp.

AMITY ROAD is a two-lane undivided Minor Arterial with a posted speed limit of 45 MPH. The road runs east from its intersection with S. Federal Way towards Warm Springs Avenue. Land uses along its length are residential and industrial.

E. WARM SPRINGS AVENUE is a two-lane undivided Minor Arterial roadway with a posted speed limit of 45 MPH. The road runs north from its intersection with SR 21 to the Riverland East and Barber Valley neighborhoods.

E. GRAND FOREST DRIVE AND E. BERGESON STREET are collector roads that lead to several residential developments. They both have a posted speed limit of 30 MPH.

S. GIGABIT LANE (AKA GATE C), TECHNOLOGY LANE (AKA GATE A), SILICON LANE, AND CIRCUIT LANE are private roadways accessing the Micron Facilities.

Table 1: Roadway Classification

Roadway	Segment	Functional Classification
Gowen Rd (SH 21)	I-84 to Warm Springs Rd	Principal Arterial
S. Federal Way	Bergeson Rd to Gowen Rd	Principal Arterial
S. Federal Way	Gowen Rd to Memory Ln	Minor Arterial
Technology Way	Gowen Rd to Circuit Ln	Minor Arterial
Amity Rd	S. Federal Way to Surprise Way	Minor Arterial
Bergeson Rd	S. Federal Way to Apple St	Collector
Grand Forest Dr	Gowen Rd to Gowen Rd	Collector
Warm Springs Rd	Gowen Rd to Eckert Rd	Minor Arterial
Eisenman Rd / Memory Ln	I-84 to S. Federal Way	Minor Arterial
Columbia Rd	Circuit Ln to End	Unclassified / Local Road

A.1.2. Transit Service

There are no fixed-route transit services in the study area that would serve the Micron campus.

A.1.3. Bicycle and Pedestrian Facilities

There are sidewalks/multi-use paths on the south side of Gowen Road (SH 21), west of S. Federal Way; on the north side of Gowen Road between S. Federal Way and Technology Way; on both sides of Federal Way, north of Gowen Road; and, on the east side of S. Federal Way, south of Gowen Road for 1.25 miles.

Gowen Road has bike lanes west of S. Federal Way. S. Federal Way has bike lanes north of Gowen Road and for a few hundred feet south of Gowen Road. Technology Way features a southbound bike lane between Gowen Road and Circuit Lane.

A.1.1. Geometrics

The specific roadway lanes, traffic control, and turn bay lengths are shown in Figure 3. The future

extension of Memory Lane and the Fab construction access road are shown on the plan for context. Similarly, the access to the new childcare center opposite Gate A is shown.

A.2. Traffic Volume

Daily (24-hour) counts, and intersection turning movement counts were recorded between 7:00 AM – 9:00 AM and 4:00 PM - 6:00 PM to isolate the AM and PM peak hour conditions. Counts were taken on September 22, 2022 for all locations except at intersection 13. Those counts were taken April 26, 2022 as part of the aforementioned childcare center traffic study. A single common peak hour was determined for all intersections; the AM Peak Hour is 7:00 to 8:00 am and the PM Peak Hour is between 4:00 and 5:00p. There are small deviations in the peak hour times from the chosen peak hour along S Federal Way in the vicinity of the Micron campus but the differences are not significant.

There is also an early morning peak between 5:15-6:15 am for Micron but the background traffic is very low. For the purposes of this study, and to be conservative in the results, the site traffic for the new Fab is assumed to be concentrated in the typical AM and PM peak hours.

Existing traffic volumes are shown in Figure 4. The peak hour volumes are shown in Table 2 and the segment volumes are shown in Table 3.

A.3. Existing Levels of Service

The LOS is based on the Highway Capacity Manual (6th Ed.), as calculated in the software Synchro® 11. Table 4 shows the criteria used to determine level of service for signalized, unsignalized, and roundabout intersections. Table 5 shows the level of service criteria for segments as outlined in ACHD standard 7106.4. The values shown are one-way, peak hour volumes.

Table 4: Level of Service Criteria

Many of the analysis parameters are established by ACHD. These are shown in Appendix D. The results of the existing conditions analysis are shown in Table 6. Movements that appear highlighted in red are LOS F and those in orange are LOS E. Table 7 shows the segment analysis for the roadways that are proximate to the development.

*Highest peak hour volume in one direction

A.4. Existing Conditions Mitigation

Gowen Road & Technology Way (signal)

The signal timing at the intersection favors Gowen Road. As such, the traffic on Technology Way and Grand Forest Drive tends to suffer with LOS E. The volume to capacity ratio (V/C) is still less than 0.90 so some capacity still exists. The more problematic movement is the northbound left turn in the PM peak hour. The Grand Forest Drive side of the intersection, while experiencing somewhat high delays, has manageable queues and adequate V/C ratios.

There are already dual northbound left turn lanes on Technology Way. It is impractical to add another turn lane since the efficiency of a third turn lane is only 60% of a single left turn lane and there is no receiving lane on SH 21. Changes in signal timing could improve the substandard movements to LOS E but will not bring all the movements to LOS D. The signal phasing could be changed to a split-phased operation and reserve all unused green time allocated to Grand Forest Drive for the Technology Way approach. In this way, more time can be allocated to the northbound left turn movement when traffic on Grand Forest Drive traffic is minimal. Moreover, since there is a limited number of thru movements and left turns coming from Grand Forest Drive, there will be fewer actuations on the north side of the road. This can be modeled in Synchro by eliminating the Grand Forest Drive left and thru movements since they would only sporadically occur during the peak hour;

however, the results are only a an approximately of the expected conditions (See Appendix E – Mitigation Section)

Recommendation(s):

- Implement traffic signal timing and phasing changes
- No ROW is required to implement this change

Gowen Road & Federal Way (signal)

The existing problems at the intersections are primarily the left turn movements and are seen during the PM peak hour. The higher volume left turns are the northbound lefts and the eastbound lefts. In the no-build condition (2025 volume without the site), the delay increases for the southbound right as well as the overall signal operations.

The intersection was somewhat recently upgraded to provide safer movements for pedestrians and bicyclists. There are dual left turn lanes in the northbound and the eastbound directions. It is possible to add a southbound left turn lane with minimal construction effort; however, adding a second turn lane would require that the phasing of the signal be changed from protected-permitted to protect-only. The difference in delay is minimal but the queue length would be halved. A second westbound left turn lane is unnecessary.

Because there are three receiving lanes on the west side of the intersection, it is possible to add a westbound through lane. This change, with some small signal timing split adjustments, would allow for LOS D operation on all movements but there would impacts to the bicycle lanes.

Recommendation(s):

- Add a southbound left turn lane by restriping the existing gore area and adding a protected-only signal phase
- Add a westbound thru lane by removing the channelizing island in the northeast corner and restriping
 - The bike lane on the west side of the intersection may have to be eliminated
- Re-time the traffic signal to account for the added capacity
- There appears to be sufficient right-of-way to accomplish the improvements.

Gowen Road & I-84 WB Ramp (signal)

The only poor operations at this intersection are the northbound left and right turn movements coming off of the ramp. The volumes are low but the PM peak hour has somewhat long delays. The longer than acceptable average delays cause a small number of vehicles have to wait a long time between green cycles. Adjusting the signal timing does little to reduce the average delay because the low arrival rate means that each vehicle will have to wait nearly a full cycle before proceeding. The queues are not long and there is plenty of capacity to handle more traffic. No improvements are recommended.

Gowen Road & I-85 EB Ramp (signal)

The left turning traffic volume on the exit ramp is high, Traffic can often back up 600 feet on the ramp. This is concerning because the ramp is only about 750 feet long and I-84 is an 80 MPH freeway, which requires more space for deceleration. More distance is needed to accommodate the queue and avoid impacting I-84.

The signal timing cycle length is 190 seconds in the AM and 220 seconds in the PM. This time is likely intended to clear the ramp so that it does not impede the I-84 mainline. However, a cycle length of this magnitude results in a long time between service intervals and contributes to a poor level of service. By contrast, a more reasonable 110 or 120 second cycle length would result in LOS D or better.

It is possible to add a third left turn lane but that would not improve the LOS without changes in timing. It would allow for more storage space and a more reasonable cycle length. However, as mentioned previously for the Gowen Road & Technology Way intersection, there is a loss of efficiency for each turn lane added – limiting the benefits of an additional lane. Building the additional space on the ramp will require both ITD and FHWA approval.

Recommendation(s):

- Retime the traffic signal to a more reasonable lower cycle-length
- Add a lane on the exit ramp to provide more storage and triple left turns
 - The additional left turn could be a re-purposing of the right turn lane plus additional pavement to add back the right turn lane
- There appears to be sufficient right-of-way to accomplish the improvement.

Federal Way & Amity Road (signal)

Amity Road is uniquely situated in an area that funnels traffic from the east towards Federal Way. There is a large volume of traffic in the AM Peak hour that turns right onto Federal Way towards Boise and the surrounding communities and performs the reverse pattern in the PM Peak hour.

One possible geometric improvement is to create a free-flow right turn lane in the westbound direction. This would mean adding a receiving lane on Federal Way, north of the intersection for at least 1000 feet. The improvement would require significant work since there is a sidewalk along the east side of Federal Way and a business with limited offset space from the sidewalk. The road would need to be widened on the west side, which would extend the construction limits. However, adding the free-flow right turn would allow for acceptable levels of service in the AM Peak Hour. (See Appendix E – Mitigation Section)

For the PM Peak hour, adding a southbound left turn lane in the existing gore area is feasible. However, while there are two receiving lanes on Amity Road, one lane is short. This will have the

effect of creating an uneven distribution of traffic in the dual left turn lanes. There should be a minimum of 1000 feet of two lanes heading east on Amity Road to make the dual left turns effective.

Recommendation(s):

- Convert the westbound dual right turns lanes to a single free-flow right turn lane
 - Add 1000 foot receiving lane north of the intersection
- Construct dual southbound left turn lanes
 - Restripe the existing gore to allow for two left turn lanes
 - Add 1000 foot receiving lane east of the intersection
 - Reconfigure the southbound left turn signal for protected-only operation
- There does not appear to be sufficient right-of-way to accomplish the improvement.
 - Additional right-of-way is needed on the east and west sides of Federal Way
 - Additional right-of-way is needed along Amity Road.

Federal Way and Bergeson Street (signal)

Similar to Amity Road, Bergeson Street serves a residential area of south Boise with commuter traffic heading towards Federal Way and then north. Unlike the Amity Road intersection, the Bergeson Street intersection already features dual southbound left turn lanes. There is no more room to add additional lanes. In the westbound direction, the right turn lane has a short receiving lane / merge area on Federal Way but the effect on LOS is minimal.

One improvement is to extend the westbound left to northbound Federal Way acceleration lane and provide a free-flow right turn lane. This would provide acceptable levels of service for all movements except the eastbound left turn. (See Appendix E – Mitigation Section). The eastbound left turn is a minor volume movement and no mitigation is recommended for that deficiency.

Recommendation(s):

- Channelize the westbound right turn lane into a free-flow right turn lane
 - Add 1000 foot receiving lane north of the intersection
- There does not appear to be sufficient right-of-way to accomplish the improvement.
 - Additional right-of-way on the east side of Federal Way may be needed.

A.5. Safety Analysis

The most current crash data (2017-2021) as documented by the Local Highway Technical Assistance Council (LHTAC) website (<http://gis.lhtac.org/safety/>) was reviewed and is summarized at each of the study intersections and road segments. (See Table 9.) Appendix F includes a more detailed account of crash types at each intersection and road segment. None of the study intersections have crash rates higher than 1.0. No mitigation has been identified.

Table 9: Accident Summary

Int No.	Intersection	Total* Crashes	PDO/Inj/Fatal	Crash Rates
1	Eisenman Rd at I-84 EB Ramp	0	0/0/0	0.00

F	Technology Way, btwn Gowen Rd and Circuit Ln	0	0/0/0	0.00
G	Columbia Rd, btwn Circuit Ln and Amber Ridge Ave	1	0/1/0	13.31

*Total number of crashes between 2017 and 2021

Figure 5. Illustration of Crashes within Study Area

A.6. Data Sources

Traffic counts were collected by Quality Counts, Inc. under contract to NV5. Roadway geometrics were observed by a site visit and field measurements. Level of Service criteria is from in the Highway Capacity Manual, 6th Ed, as shown in Table 4. Segment LOS is from ACHD 7106.4.1 Table 2. Crash data is reported by the Idaho Local Highway Technical Assistance Council. Annual average daily volume used in the calculation of crash rates are provided by ITD AADT on-line reference.

Background Conditions

B.1. Planned Roadway and Approved Development Projects

There is a planned connector road in the Integrated Five-Year Work Plan (IFYWP) for 2022-2026. The road would go between Memory Lane and Columbia Road. The alignment of the road has not been determined and no plans current exist. The road was not considered for this traffic study. There is also in the IFYWP a future widening of Amity Road but the date of such a widening appears to be well into the future.

B.2. Background Data

Future 2025 turning movement conditions were forecast utilizing localized growth rates as provided by COMPASS. Table 10 shows the growth changes from the COMPASS model. Figure 6 shows the recommended annual growth rates for each corridor. These annual rates were applied to existing traffic counts for three years to determine future year background traffic conditions. No other background projects were considered.

Table 10: Growth Rates

Location	2025	2030	Calculated Growth	COMPASS Rate*	Growth Factor 2022-2025
SH 21 w/o Eisenman Rd	826	859	0.79%	2.5%	1.08
SH 21 w/o Federal Way	3535	3674	0.77%	1.6%	1.05

B.4. Background Growth Conditions Mitigation

Gowen Road & Technology Way (signal)

As background traffic continues to grow on Technology Way, signal timing will not be able to achieve acceptable operations. A multi-lane roundabout would result in acceptable levels of service. The recommended configuration should include two lanes within the roundabout, an eastbound by-pass lane and a southbound by-pass lane. The roundabout will need to be large to accommodate the number of lanes and large trucks on both SH 21 and on Technology Way – an approximately 135 to 150-foot inscribed circle. However, the resulting LOS would be C or better for all movements. (See Appendix E – Mitigation Section)

Recommendation(s):

- Implement traffic signal timing and phasing changes as traffic growth continues.

- Program a multi-lane roundabout to be constructed with EB and SB by-pass lanes once background growth and site traffic volumes reach levels where signal timing changes will no longer be adequate

The right-of-way to construct such a large roundabout would exceed the space available.

Table 13 shows the results of mitigation from both the existing conditions improvements (see Section A.4) and the background growth conditions improvements.

B.5. Data Sources

COMPASS supplied the forecasts for 2025 and 2030 PM peak hour traffic. No other approved developments were provided or incorporated into the projections for 2025 'no-build' analysis.

Projected Traffic

C.1. Project Trip Generation

The development will include 2,000 new Micron associates plus 750 “sustaining” contractors. Because there are several buildings that are needed to support the operation but a total of 2750 employees, “Manufacturing” using an independent variable of number of employees is the appropriate land-use category. The number of trips generated by the proposed development was estimated using the equations provided in the ITE Trip Generation Manual, 11th Edition. The following table provides a summary of these results for daily, AM peak hour, and PM peak hour conditions. The land-use does not include separate values for pass-by traffic or internal trips and was not accounted for in this study.

Table 14: Trip Generation

Land Use	Trips	Daily	AM			PM		
			In	Out	Total	In	Out	Total
Manufacturing (LU 140) 2,750 Employees*	Auto	5,661	487	173	660	215	370	585
	Trucks	513	16	13	29	11	15	26
	Total	6,174	503	186	689	226	385	611

*includes sustaining contractors

C.2. Trip Distribution and Assignment

The assignment and directional distribution of new project trips on the transportation network are based on the expected facility’s employment service areas, population density in Boise, ID, and input from COMPASS. The home cities of current employees are shown in Figure 8. Truck distribution is based on the expected outlets to interstate travel. The intersection-specific percentages and assignment of the site trips are shown in Figures 10 through 13.

Traffic Analyses

D.1. Build Condition Capacity Analysis

The results of build conditions capacity for intersection (2022 volumes plus background growth plus site traffic) are shown in Table 15 and include the analysis of the volumes shown in Figure 13.

*Highest peak hour volume in one direction

D.2. Build Conditions Mitigation

Eisenman Rd at I-84 WB On-Ramp

The intersection geometry is unique to the traffic conditions. There is currently no east side of the intersection so the eastbound left turning traffic (i.e., traffic heading north on S Federal Way) can move unimpeded. Only the northbound traffic coming from I-84 is stopped and that volume is projected to be manageable. HCM 6th Ed. does not include the ability to analyze the intersection in its current form but can if a dummy link is added to the east side of the intersection.

If Memory Lane is to be used as a construction traffic route for FAB1, the intersection at S Federal Way will need to be reconfigured. At a minimum, the southbound movement on S Federal Way will

need a left turn lane. Memory Lane Ext will need one lane leaving and one lane entering the construction area. The analysis of construction period traffic is not included in this study but will be a separate effort. The intersection may need to be signalized if the construction traffic analysis shows a significant and sustained volume of traffic to/from the construction site.

Recommendation(s):

- Re-configure the southbound approach to the intersection to include a left turn lane
- Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane
- Consider a construction-era traffic signal if volumes are significant

S Federal Way & Gate C / Gigabit Lane (signal)

Gate C will serve as the primary access for the parking lots on the south side of the Micron campus – which is where most of the parking will be located. The FAB1 development and most of the parking will have direct access to Gate C and easy access to the Eisenman interchange with I-84. The intersection has ample capacity to accommodate the future traffic primarily because it is signalized and the volume on S Federal Way is low.

S Federal Way & Gate B

Gate B is the next closest access point for the parking lots on the southern end of the Micron campus. Currently, during shift change, there is a large volume of traffic leaving Gate B but almost all of it makes a right turn and heads north on S Federal Way. Conversely, in the AM peak hour, there is a large volume of southbound left turning vehicles entering the site. The intersection is stop controlled and already experiences some delays for left-out traffic. The additional load from FAB1 traffic will overburden the intersection. A traffic signal may be needed but does not meet the required MUTCD volume criteria. (See Section D.3. for a signal warrant discussion.)

Recommendation(s):

- Consider a traffic signal (subject to warrant analysis) to accommodate site traffic demands
- If a traffic signal is not allowed, eliminate the left turns out of the Micron campus
 - This would force traffic leaving the campus heading south to use Gate A or Gate C.
 - The additional traffic load on the signal at Gate C would not degrade the level of service at that intersection. (See Appendix E – Mitigation Section)

Table 17 shows the results of mitigation from the existing conditions improvements (see Section A.4) the background growth conditions improvements (see Section B.4) and the build conditions improvements.

E.1.1. Eisenman Road & I-84 EB Ramp

The intersection has ample capacity to accommodate the future traffic.

E.1.2. Eisenman Road & I-84 WB On-Ramp

While HCM 6th Ed. lacks the research to make the capacity calculations, an evaluation of the volume of traffic shows that the intersection can accommodate the future traffic. The additional westbound traffic on Eisenman Road should pose no significant delay for eastbound left turning traffic.

E.1.3. Memory Lane & S Federal Way/I-84 WB Off-Ramp

Build Conditions Recommendation(s):

- Re-configure the southbound approach to the intersection to include a left turn lane
- Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane
- Consider a construction-era traffic signal if volumes are significant

E.1.4. S Federal Way & Gate C / Gigabit Lane (signal)

Gate C will serve as the primary access for the parking lots on the south side of the Micron campus – which is where most of the parking will be located. The FAB1 development and most of the parking will have direct access to Gate C and easy access to the Eisenman interchange with I-84. The intersection has ample capacity to accommodate the future traffic primarily because it is signalized and the volume on S Federal Way is low.

E.1.5. S Federal Way & Gate B

Build Conditions Recommendation(s):

- Consider a traffic signal (subject to warrant analysis) to accommodate site traffic demands
- If a traffic signal is not allowed, eliminate the left turns out of the Micron campus
 - This would force traffic leaving the campus heading south to use Gate A or Gate C.
 - The additional traffic load on the signal at Gate C would not degrade the level of service at that intersection. (See Appendix E – Mitigation Section)

E.1.6. S Federal Way & Silicon Way

The intersection has ample capacity to accommodate the future traffic.

E.1.7. Gowen Road & Technology Way (signal)

Existing Conditions Recommendation(s):

- Implement traffic signal timing and phasing changes as traffic growth continues.

Background Conditions Recommendation(s):

- Program a multi-lane roundabout to be constructed with EB and SB by-pass lanes once background growth and site traffic volumes reach levels where signal timing changes will no longer be adequate

E.1.8. Gowen Road & Federal Way (signal)**Existing Conditions Recommendation(s):**

- Add a southbound left turn lane by restriping the existing gore area and adding a protected-only signal phase
- Add a westbound thru lane by removing the channelizing island in the northeast corner and restriping
 - The bike lane on the west side of the intersection may have to be eliminated
- Re-time the traffic signal to account for the added capacity

E.1.9. Gowen Road & I-84 WB Ramp (signal)

The only poor operations at this intersection are the northbound left and right turn movements coming off of the ramp. The volumes are low but the PM peak hour has somewhat long delays. The longer than acceptable average delays cause a small number of vehicles have to wait a long time between green cycles. Adjusting the signal timing does little to reduce the average delay because the low arrival rate means that each vehicle will have to wait nearly a full cycle before proceeding. The queues are not long and there is plenty of capacity to handle more traffic. **No improvements are recommended.**

E.1.10. Gowen Road & I-85 EB Ramp (signal)**Existing Conditions Recommendation(s):**

- Retime the traffic signal to a more reasonable lower cycle-length
- Add a lane on the exit ramp to provide more storage and triple left turns
 - The additional left turn could be a re-purposing of the right turn lane plus additional pavement to add back the right turn lane

E.1.11. Technology Lane & Circuit Way

The intersection has ample capacity to accommodate the future traffic.

~~**E.1.12. Memory Lane Ext & Construction Access Road (not studied)**~~

E.1.13. Federal Way & Gate A / Childcare Center

This intersection was studied in detail in a separate report for the childcare center development. While the new Fab traffic will contribute more traffic on S Federal Way, it will not be enough to justify a traffic signal once the new childcare center is operational. There is additional land yet to be developed on the west side of S Federal Way that will share the access point. This intersection should be monitored for the need for a traffic signal as more development occurs. **No improvements are recommended.**

E.1.14. Gowen Road & Warm Springs Avenue

The intersection has ample capacity to accommodate the future traffic.

E.1.15. Federal Way & Amity Road (signal)

Existing Conditions Recommendation(s):

- Convert the westbound dual right turns lanes to a single free-flow right turn lane
 - Add 1000 foot receiving lane north of the intersection
- Construct dual southbound left turn lanes
 - Restripe the existing gore to allow for two left turn lanes
 - Add 1000 foot receiving lane east of the intersection
 - Reconfigure the southbound left turn signal for protected-only operation

E.1.16. Federal Way and Bergeson Street (signal)

Existing Conditions Recommendation(s):

- Channelize the westbound right turn lane into a free-flow right turn lane
 - Add 1000 foot receiving lane north of the intersection

E.2. Mitigation Capacity Analysis Results

Table 19 shows the results of the capacity analysis (LOS only) for the mitigation measures referenced above.

Table 19: LOS of Mitigation Measures

SBTR	A	C	A	C	A	C		

E.3. Driveway Analysis

All the site access points are existing. No additional analysis is required.

E.4. Parking Requirements

In order to construct the new Fab and associated office, utility, warehouses, and other ancillary building, the existing parking lot on the south side of the campus will be removed. New parking structures and surface parking lots are planned to be built and have been identified on the site plan. Approximately 3,800 parking spaces will be removed and approximately 7,100 parking spaces will be added with the project (a net change of about 3,300), which will sufficiently serve the new 2,750 employees.

E.5. Signal Warrant Analysis

The intersection of S Federal Way and Gate B may benefit from a traffic signal. It would reduce the delay for traffic turning left out of the site. Eight hours of traffic volume on the minor street side were not available; however, an analysis of the major street traffic shows that there is not enough traffic to meet the minimum criteria in the 2009 edition of the Manual on Uniform Traffic Control Devices (MUTCD, 2009). Even if the site traffic met the minimum threshold for eight hours of the day, the combination of the main street and minor street traffic would not trigger a need.

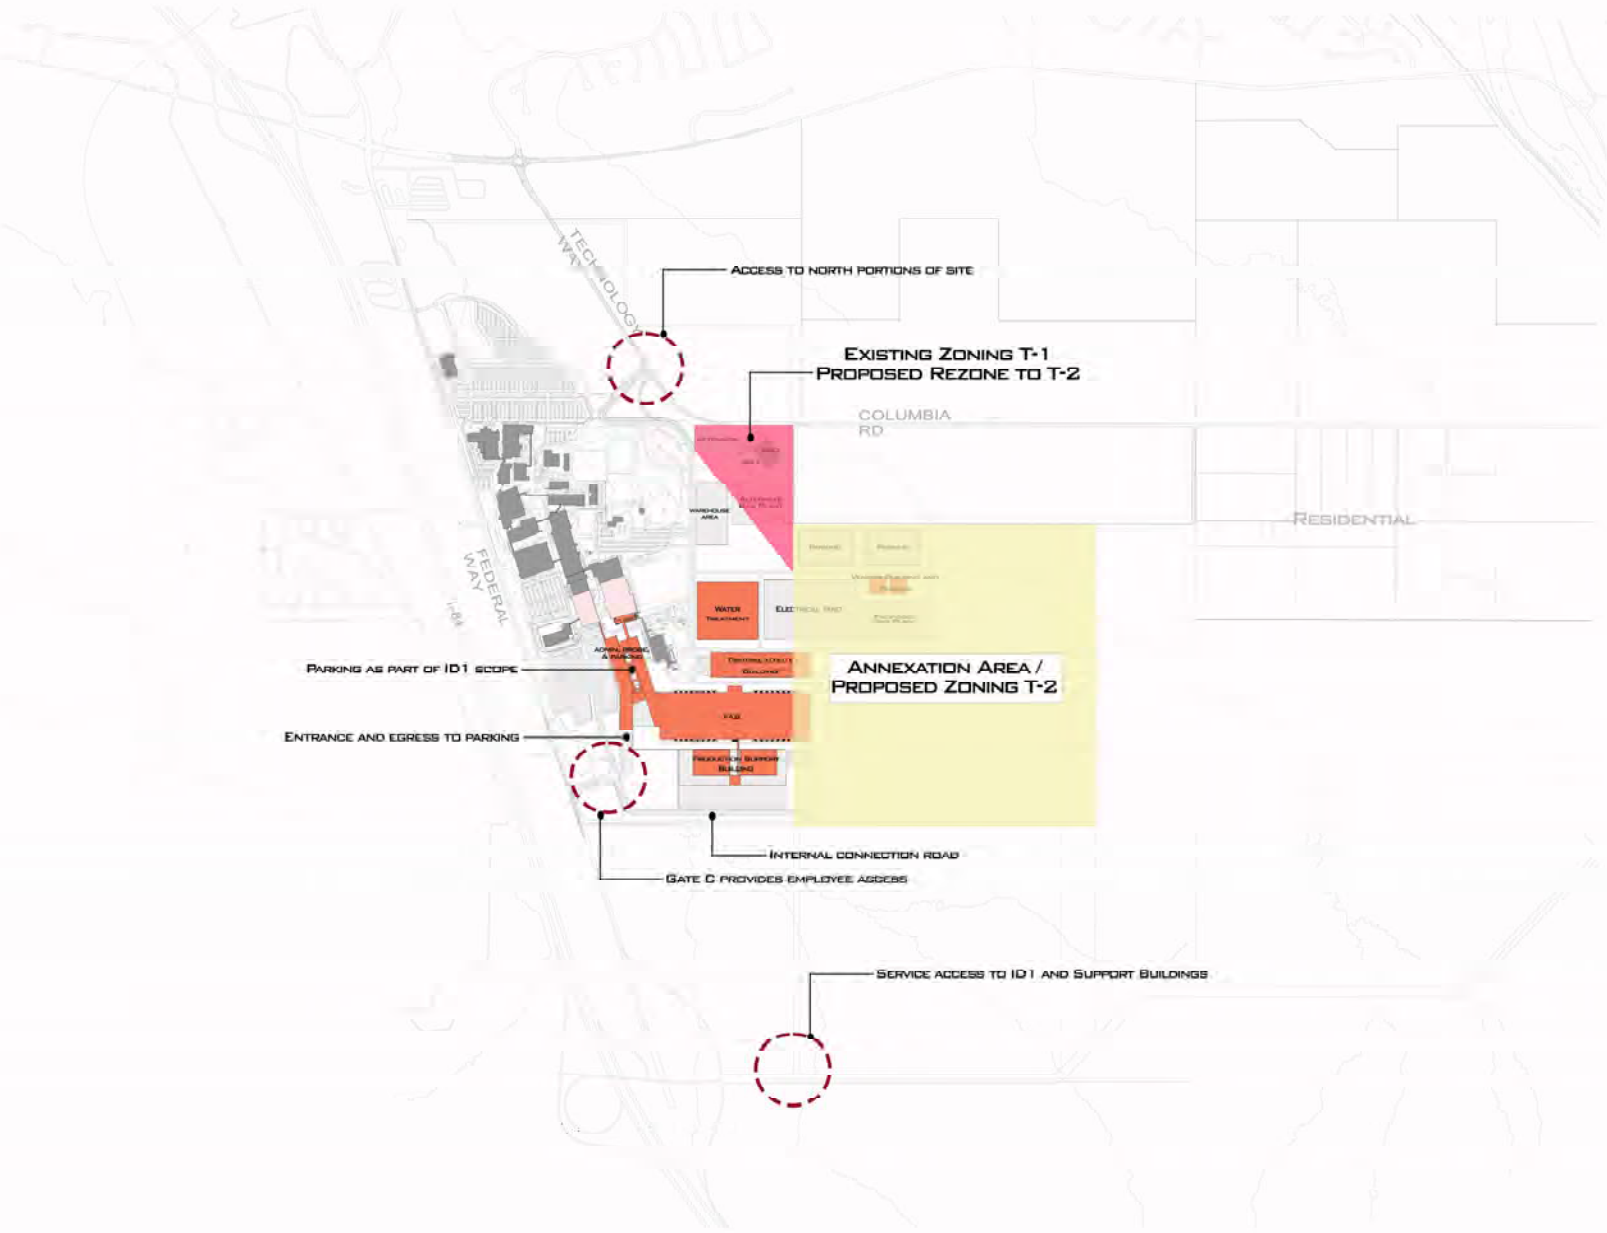

Table 20: Signal Warrant Analysis Summary

Hour Beginning	S Federal Way	Gate B	WARRANT 1 Major Street Condition Met? (Major>600)	WARRANT 1 Minor Street Condition Met? (Minor>150)
	Combined Volume	Approach Volume w/ Right Turns		
5:00 AM	682		YES	
6:00 AM	494		NO	
7:00 AM	909	84	YES	NO
8:00 AM	852		YES	
9:00 AM	473		NO	
10:00 AM	252		NO	
11:00 AM	337		NO	
12:00 PM	375		NO	
1:00 PM	291		NO	
2:00 PM	301		NO	
3:00 PM	419		NO	
4:00 PM	374	655	NO	YES
5:00 PM	696		YES	
6:00 PM	440		NO	
7:00 PM	173		NO	
Number of Hours Needed			8	8
Number of Hours Met			4	1
Warrant Satisfied?			NO	

Data Source: S Federal Way base volume from signal warrant study conducted for Gate A and the proposed childcare center; the base volume was multiplied by the growth factor for S Federal Way as shown in Table 7. The peak hour volumes are from Figure 13.

Deborah E. Nelson, Givens Pursley, LLP

Date: October 10, 2022

Re: Traffic Impact Study Scoping Documentation
Proposed Micron FAB1 Development, S Federal Way, Boise, ID

This memorandum conveys current information related to the preliminary scope of a Traffic Impact Study (TIS) for a microprocessor fabrication facility in Boise, Idaho. The following include trip generation, study area, background growth, nearby approved development, trip distribution and analysis scenarios.

Site Description

The TIS will comply with all the requirements of the ACHD including analysis, reporting, and development of any necessary mitigation measures meeting minimum design Level-of-Service (LOS) D for suburban roadways and intersections. The proposed development will include several buildings in support of the main fabrication building. The buildings will be east of S Federal Way, north of Memory Lane, and west of Columbia Road. There will be multiple points of egress for the development, all of which are existing. Construction traffic will utilize a temporary road, which will be the extension of Memory Lane.

This study will consider only the first phase of development which will be the Fab building, related office and support buildings, and a vendor building. The site location is shown in Figure 1.

Site Access

Access to the site will be available from existing driveways along S Federal Way and Technology Way.

Figure 1. Site Location and Study Area Map

Site Trip Generation

A new manufacturing facility will be built on land adjacent to the existing Micron R&D campus. The development will include 2,000 new Micron associates plus 750 “sustaining” contractors. Because there are several buildings that are needed to support the operation but a total of 2750 employees, “Manufacturing” with an independent variable of number of employees is the more prudent land use category. The number of trips generated by the proposed development was estimated using the equations provided in the ITE Trip Generation Manual, 11th Edition. The following table provides a summary of these results for daily, AM peak hour, and PM peak hour conditions.

Table 1. Trip Generation

Land Use	Trips	Daily	AM			PM		
			In	Out	Total	In	Out	Total
Manufacturing (LU 140) 2,750 Employees*	Auto	5,661	487	173	660	215	370	585
	Trucks	513	16	13	29	11	15	26
	Total	6,174	503	186	689	226	385	611

*includes sustaining contractors

Trip Distribution and Trip Assignment

The assignment and directional distribution of new project trips on the transportation network are based on the expected facility’s employment service areas, population density in Boise, ID, and input from COMPASS. The home locations of current employees is tabulated in Table 2 and shown in Figure 2.

Table 2. Employee Home Base

Current Employee Home City	% of Total
Boise	63%
Meridian	19%
Nampa	6%
Kuna	4%
Caldwell	2%
Eagle	2%
Mountain Home	1%
Middleton	1%
Star	1%
Garden City	0.4%
Emmett	0.4%
Idaho City	0.2%

Figure 2. Employee Home Base

Truck distribution is based on the expected outlets to interstate travel. The intersection-specific percentages and assignment of the site trips are shown in Figures 3-5.

Figure 3. Macro Area Trip Distribution – Autos and Trucks

Study Locations

The following intersections and road segments (as illustrated in Figure 1) will be analyzed:

- Intersections
 1. Eisenman Rd & I-84 SB Ramp
 2. Eisenman Rd & I-84 NB On-Ramp
 3. Memory Ln & Federal Way/I-84 NB Off-Ramp
 4. Federal Way & Gate C (signal)
 5. Federal Way & Gate B
 6. Federal Way & Silicon Way
 7. Gowen Road & Technology Way (signal)
 8. Gowen Road & Federal Way (signal)
 9. Gowen Road & I-84 NB Ramp (signal)
 10. Gowen Road & I-85 SB Ramp (signal)
 11. Technology Ln & Circuit Way
 - ~~12. Memory Ln & Fab Access Road~~
 13. Federal Way & Gate A / Childcare Center
 14. Gowen Road & Warm Springs Ave
 15. Federal Way & Amity Rd (signal)
 16. Federal Way and Bergeson St (signal)
- Segments
 - A. Federal Way, South of Silicon Way
 - B. Gowen Road, Btwn I-84 NB Ramp and Federal Way
 - C. Memory Ln, Btwn I-84 NB On-Ramp and Federal Way
 - D. Technology Way, Btwn Gowen Road and Circuit Way
 - E. Columbia Road, east of Circuit Way

Traffic Counts

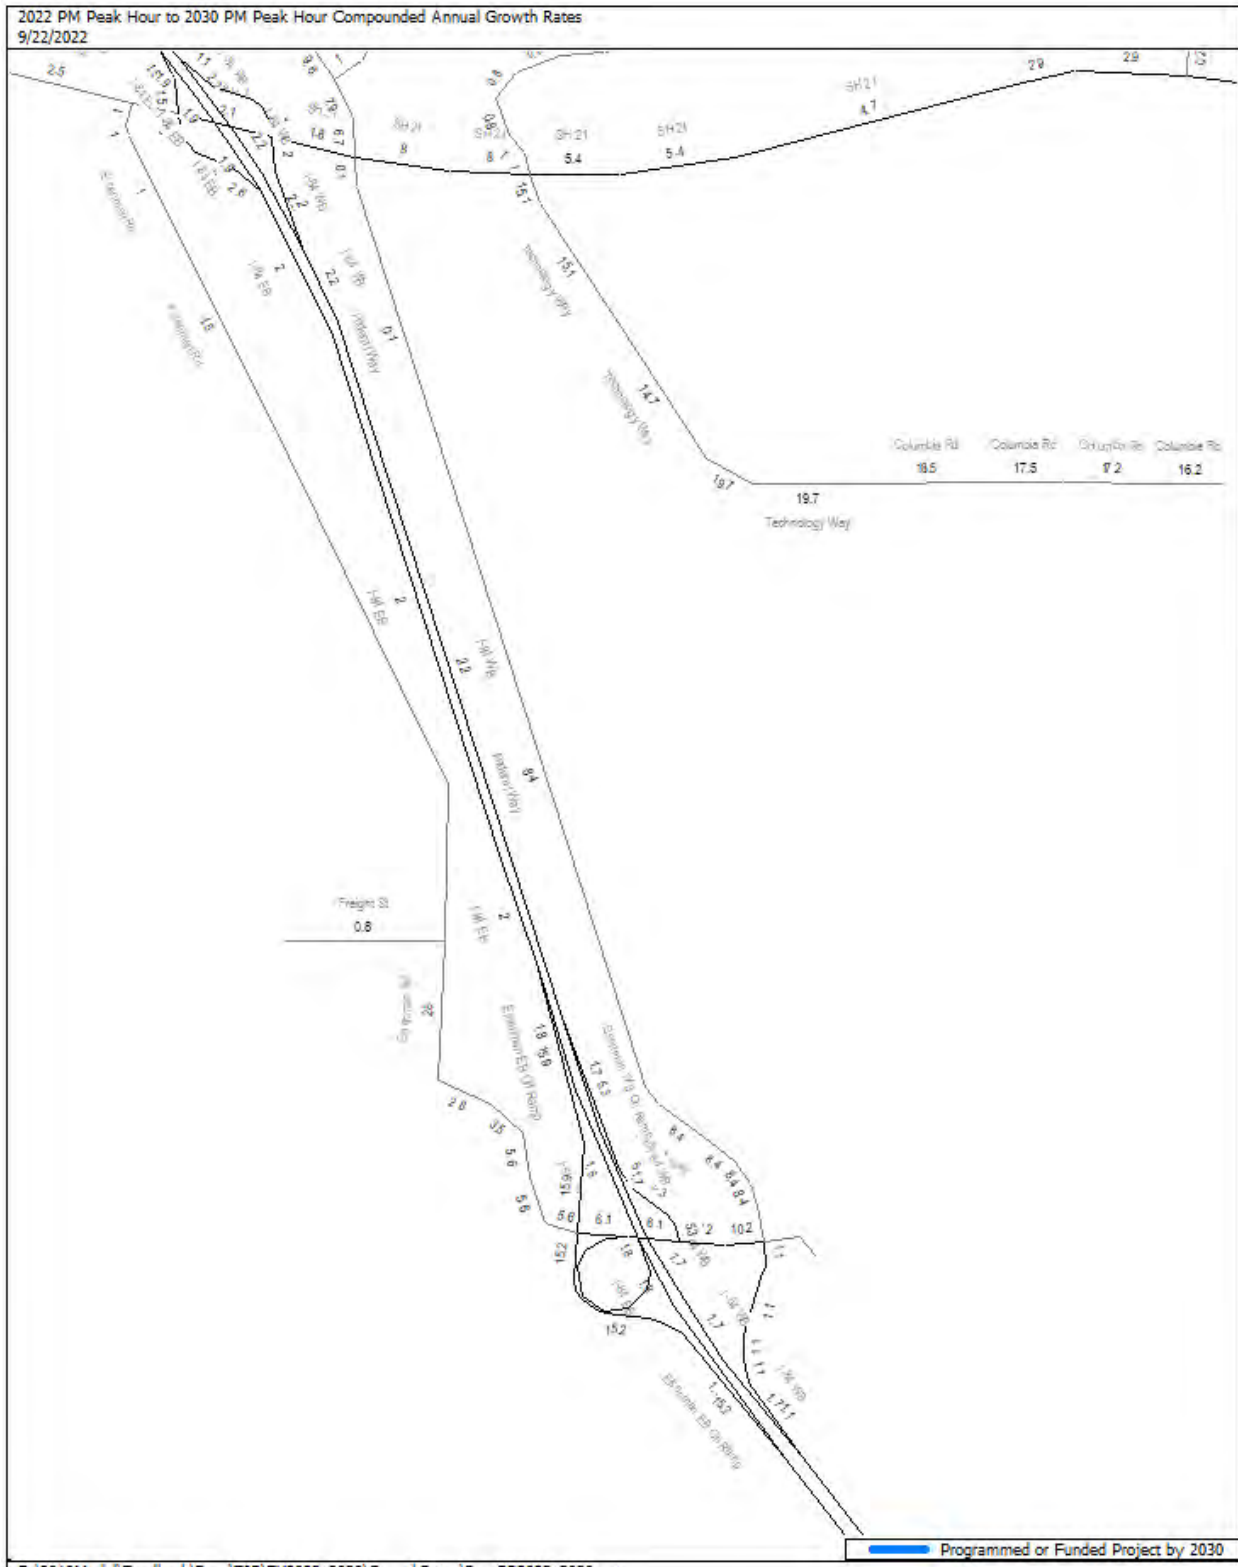

Daily (24-hour) counts, and Intersection turning movement counts will be recorded between 7:00 AM – 9:00 AM and 4:00 PM - 6:00 PM to isolate the AM and PM peak hour conditions. Based on previous traffic counts, the AM Peak Hour is generally between 7:45 and 8:45 am. The PM Peak Hour is between 4:15 and 5:15p. There is also an early morning peak between 5:15-6:15 am for Micron but the background traffic is very low.

Background Growth

Future 2025 turning movement conditions will be forecast utilizing growth rates provided by COMPASS. Table 3 shows the growth changes from the COMPASS model. Figure 7 shows the annual growth rates for each corridor. These rates will be applied to existing traffic counts for three years to determine future year background traffic conditions. No other background project traffic will be considered.

Location	2022-2030 Annual Growth	Growth Factor 2022-2025
SH 21 w/o Eisenman Rd	2.5%	1.08
SH 21 w/o Federal Way	1.6%	1.05
SH 21 e/o Federal Way	8.0%	1.26
SH 21 e/o Technology Way	5.4%	1.17
SH 21 w/o Warm Springs	2.9%	1.09
Federal Way s/o SH 21	1.0%	1.00
Federal Way n/o Yamhill Rd	9.6%	1.32
Technology Way, s/o SH 21	15.1%	1.52
Columbia Rd e/o Circuit Way	19.7%	1.72
Eisenman Pkwy/Memory Ln	6.1%	1.19

Figure 7. COMPASS 2022 to 2030 Compounded Annual Growth Rates

Signal Warrants

Signal warrant analysis will be performed for any intersection that is found to exceed ACHD's acceptable v/c ratio of 1.0 in the analysis.

Planned Roadway & Approved Development Projects

There is a planned connector road in the Integrated Five-Year Work Plan (2022-2026). The road would go between Memory Lane and Columbia Road. The alignment of the road has not been determined and no plans current exist. The road will not be considered for this traffic study. Also in the IFYWP is a future widening of Amity Road but the date of such a widening appears to be well into the future.

Analysis Scenarios

Capacity analyses will be completed utilizing Synchro 11® and *Highway Capacity Manual, 6th Edition* methodology. All study intersections will be analyzed during the surrounding roadways' weekday AM and PM peak hours under the following traffic scenarios:

- Existing (2022) Traffic Volume and Roadway Conditions
- Existing + Background Growth (2025) with Existing Roadway Conditions
- Existing + Background (2025) + Phase 1 Build with Existing Roadway Conditions

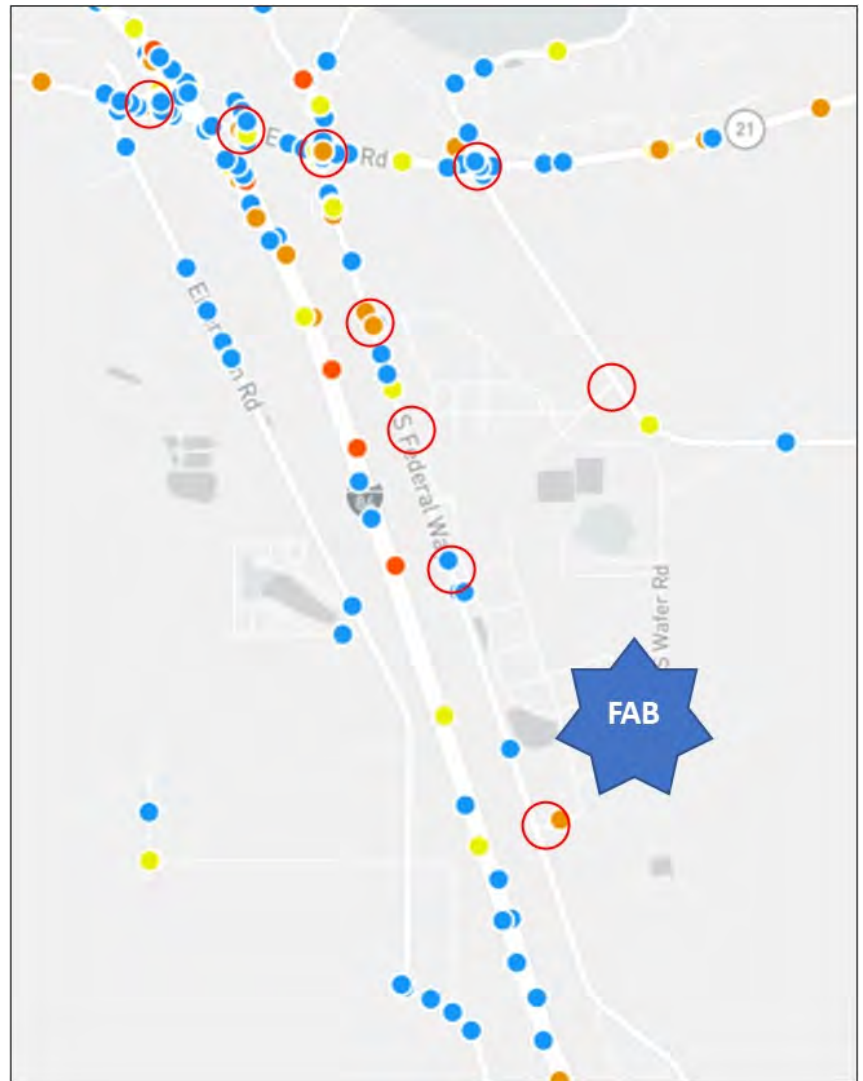

Traffic Operations and Safety Review

The most current crash data (2017-2021) as documented by the Local Highway Technical Assistance Council (LHTAC) website (<http://gis.lhtac.org/safety/>) will be reviewed and summarized at each of the project area intersections. If certain crash trends exist, they will be noted along with possible countermeasure improvements that could be implemented to reduce crash frequency. A further safety review at these locations will not be completed.

A traffic operations review will be performed at the previously noted intersections using Synchro 11 software. In accordance with ACHD Policy, the maximum overall intersection v/c ratio is 0.90 for signalized intersections while the maximum lane group v/c ratio for signalized and unsignalized intersections is 1.0, and 0.85 for roundabouts. Default values as summarized in Policy 7106.6 will be assumed.

Roadway segments will be evaluated using the ACHD LOS Planning Threshold table. Based on the current ACHD Policy Manual, the minimum acceptable LOS for a roadway segment is LOS E for principal arterials and minor arterials, and LOS D for collectors.

Driveway locations will be reviewed to determine if ACHD Access Spacing Policy is met. Additionally, a turn lane analysis in accordance with NCHRP 457 will be performed at the site access points to determine if auxiliary right and left turn lanes are warranted.

Study Area Crashes – 2017-2021 (Source LHTAC)

Report

The TIS report will be prepared with adherence to TIS requirements found in the ACHD General Requirements and Procedures for Development except as may be deviated by this document.

Construction Period Traffic

In a separate analysis and memo, the construction traffic will be assessed relative to the plans and recommendations identified in the TIS. The number of construction vehicles and contractor private vehicles – over time – will be estimated and the expected distribution and relative impacts will be considered. Graphics showing the volume of traffic through the study area will be included in the technical memo. No detailed capacity analysis will be performed unless the volume of traffic appears to be concentrated in any one area and believed to cause problems. In that case, limited capacity analysis will be performed to determine possible construction-time period mitigation.

APPENDIX D: Highway Capacity Worksheets

The following is the required setup for capacity analysis per ACHD guidelines. These were followed, as applicable, in the Synchro analysis.

Variable	Existing Analysis	Future Year Analysis
HCS Analysis Type ¹	Operations	
HCS Report Type	Full Report and Back of Queue Worksheets or Long Report	
HCM Analysis Duration	0.25 hours	
PHF	Actual by approach	0.90 ²
RTOR	Actual count or 0	Existing percentage or 0
Unit Extension	3 sec	
Arrival Type	HCM Exhibit 10-18	
Start Up Time	2 sec	
Extension of Effective Green Time	2 sec	
Walking Speed	4 ft/sec ³	3.5 ft/sec ³
Pedestrian Volume	Actual count or 400 CBD or 50 non-CBD	
Pedestrian Travel Distance	Distance from top of ramp to opposite curb	
Lane Utilization Factor	HCM Exhibit 10-23	
Phasing	Existing	Leading/Protected left turns
Actuation Type	Existing	Fully actuated except Boise CBD
Cycle Length	Use Cycle Length from Table	
Base (Ideal) Saturation Flow Rate	1800	
Lane Width Existing	Existing	Existing ⁴
% Heavy Vehicles	Existing %	
% Grade	Existing %	
Parking maneuvers per hour	HCM Exhibit 10-20	
Bus Stops per hour	HCM Exhibit 10-21	
Yellow Time	4 sec 40 mph and under; 5 sec over 40 mph	
Red Time	1 sec	
Min Vehicle Green Time	5 sec	
Min Pedestrian Green Time	5 sec	
Upstream filtering adjust factor	HCM Exhibit 15-7 5	

¹The preferred software is the latest version of the HCS or Synchro.

²Use existing PHF if existing PHF is > 0.90 and no capacity improvements are planned.

³Use walking speed of 3 ft/sec around certain land uses such as schools.

⁴Use ACHD Policy Manual if improvements will be completed by analysis year.

⁵Use value of 1.0 if nearest upstream signal is greater than 1/2 mile away.

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other
 Cycle Length: 190
 Actuated Cycle Length: 190
 Offset: 0 (0%), Referenced to phase 2:WBTL and 6:EBT, Start of Green
 Natural Cycle: 60
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.98
 Intersection Signal Delay: 47.7
 Intersection LOS: D
 Intersection Capacity Utilization 80.5%
 ICU Level of Service D
 Analysis Period (min) 15
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

Intersection Summary

Area Type:	Other
Cycle Length:	130
Actuated Cycle Length:	130
Offset:	126 (97%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green
Natural Cycle:	145
Control Type:	Actuated-Coordinated
Maximum v/c Ratio:	1.28
Intersection Signal Delay:	99.2
Intersection LOS:	F
Intersection Capacity Utilization	87.3%
ICU Level of Service	E
Analysis Period (min)	15
~	Volume exceeds capacity, queue is theoretically infinite. Queue shown is maximum after two cycles.
#	95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
m	Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other
 Cycle Length: 110
 Actuated Cycle Length: 110
 Offset: 32 (29%), Referenced to phase 2:NBTL and 6:SBT, Start of Green
 Natural Cycle: 135
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 3.36
 Intersection Signal Delay: 138.9 Intersection LOS: F
 Intersection Capacity Utilization 67.0% ICU Level of Service C
 Analysis Period (min) 15
 ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Area Type:	Other
Cycle Length:	110
Actuated Cycle Length:	110
Offset:	50 (45%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green
Natural Cycle:	145
Control Type:	Actuated-Coordinated
Maximum v/c Ratio:	1.76
Intersection Signal Delay:	115.9
Intersection LOS:	F
Intersection Capacity Utilization	89.7%
ICU Level of Service	E
Analysis Period (min)	15
~	Volume exceeds capacity, queue is theoretically infinite. Queue shown is maximum after two cycles.
#	95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
m	Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

HCM 6th Ctrl Delay	86.2
HCM 6th LOS	F

Notes

- User approved pedestrian interval to be less than phase max green.
- User approved volume balancing among the lanes for turning movement.

Intersection Summary

Area Type: Other
 Cycle Length: 90
 Actuated Cycle Length: 90
 Offset: 88 (98%), Referenced to phase 2:WBT and 6:EBT, Start of Green
 Natural Cycle: 110
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.84
 Intersection Signal Delay: 22.3 Intersection LOS: C
 Intersection Capacity Utilization 63.2% ICU Level of Service B
 Analysis Period (min) 15
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

Splits and Phases: 8: S Federal Way & Gowen Rd

Intersection Summary

HCM 6th Ctrl Delay	33.7
HCM 6th LOS	C

Notes

- User approved pedestrian interval to be less than phase max green.
- User approved volume balancing among the lanes for turning movement.
- Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

**K = DHV / AADT

***V = Intersection Peak Volume / K

Crashes for spots (such as intersections) are normally expressed in terms of crashes per million entering vehicles (MEV). Use the following formula:

$$R = (A \times 10^6) / (365 \times T \times V)$$

where,
 R = crash rate
 A = number of reported crashes
 T = time period of the analysis in years
 V = daily entering volume at the intersection

*Source: Idaho AADT ArcGIS map, 2021 volumes

Crashes for roadway segments are normally expressed in terms of crashes per 100 million vehicle-miles (100MVM). Use the following formula:

$$R = (A \times 10^8) / (365 \times T \times V \times L)$$

where,
 R = crash rate
 A = number of reported crashes
 T = time period of the analysis in years
 V = AADT
 L = Length of the segment in miles

APPENDIX F: SIGNAL TIMING PARAMETERS

TRAFFIC IMPACT STUDY FOR

FAB1 MANUFACTURING FACILITY

DATE:

January 18, 2023

LOCATION:

Boise, ID

PREPARED FOR:

Micron

PREPARED BY:

NV5
690 S. Industry Way, Suite 10
Meridian, ID 83642

1-18-2023

EXECUTIVE SUMMARY

A new advanced memory fabrication facility, called FAB1, will be located on the Micron R&D campus along S. Federal Way in Boise, ID. FAB1 includes several buildings. The primary structure will be a manufacturing facility that includes an approximately 600,000 square foot “clean” room plus support spaces. To support the Fab, there will be utility buildings, administration buildings, and a vendor/contractor support facility along with parking structures and surface lots.

The following study scenarios were included:

- Existing (2022) Traffic Volume and Roadway Conditions
- Existing + Background Growth (2025) with Existing Roadway Conditions
- Existing + Background (2025) + Project Build with Existing Roadway Conditions

FAB1 will include 2,750 employees of Micron and onsite vendors and, for the purposes of estimating number of trips, is considered a manufacturing land use. The new development will produce 6,174 trips per day with 11% occurring between 7:00 and 8:00 am and 10% occurring between 4:00 and 5:00 pm.

The traffic impact study was conducted in accordance with the approved scoping memorandum and the ACHD Policy Manual. The study network included 12 intersections and four (4) road segments. New traffic counts were collected to set a baseline for the analysis. Traffic growth was estimated using COMPASS’s model output. The expected distribution of auto traffic is approximately 25% to the south via I-84, 10% to the east on SH 21, 10% to the west on Gowen Road and the remaining 55% to the north and west via either Federal Way or I-84. FAB1’s parking lots will be close to the existing Gate C (aka Gigabit Lane). The intersection of Gigabit Lane and S Federal Way will be the primary employee access for the site. Secondary access and parking for utility areas is located on the north side of the campus. Construction traffic will access the site via an extension of Memory Road Rd and the Eisenman exit from I-84. All roads internal to the Micron campus are private roads.

For the **existing traffic conditions**, two (2) intersections were found to have capacity deficiencies.

- Federal Way at Amity Road
 - The typical commute pattern includes a heavy westbound right turn in the morning and a heavy southbound left turn in the evening. The high volume of traffic results in a level of service F in both the AM and PM for the westbound right and a level of service E in the PM for the southbound left. The traffic volume from the small business on the west side of the intersection is very low and should not be a factor in the mitigation. The recommended improvements include:
 - Add a right-turn overlap signal for the westbound right turns

- Construct dual southbound left turn lanes
 - Add 1000 foot receiving lane east of the intersection
- Reconfigure the southbound left turn traffic signal for protected-only operation
- Reconfigure the northbound left turn traffic signal for permitted operation
- Remove the split-phased operation
- Re-time the traffic signal to account for the added road capacity

There appears to be right-of-way along Amity Road to accomplish the improvements

- Federal Way at Bergeson Avenue

Similar commute patterns as Amity Road exist along Bergeson Avenue. The westbound right turn volume is high. There is a short acceleration lane but it does not allow for a free-flow movement and therefore long delays for right turning vehicles heading toward Boise. That movement experiences a level of service F in the both the morning and evening peak hours. The split-phased signal hinders efficient operations but it is necessary based on the lane assignments. While there is a delay for the southbound left turn (LOS E), the recommended improvements, combined with the necessary signal re-timing, will bring the intersection to acceptable levels of service. An illustration of the recommendation is below

- Add a channelizing island for the westbound right turn movement
- Add a right-turn overlap signal for the westbound right turn movement
- Extend the left turn lane on Bergeson to a total of 500 feet to allow for thru and right turning vehicles to bypass the queue
- Change the eastbound shared left-thru lane to an exclusive left turn lane
- Remove the split-phased operation
- Re-time the traffic signal to account for the added road capacity

There appears to be sufficient right-of-way to accomplish the improvements.

When general growth in traffic volume is added to the existing conditions (i.e., background growth), the aforementioned conditions will naturally worsen but no new intersections be negatively impacted. Federal Way at Bergeson Street will degrade to an overall v/c ratio of 0.94. Per ACHD policy, this would require additional improvements. There are no solutions other than adding more capacity on Federal Way (i.e., three thru lanes in each direction) that would improve the v/c to acceptable levels. However, this solution would require extensive construction and may not be feasible considering topography and right-of-way limitations. The overall level of service would be a D with the improvements recommended for the existing condition. No additional improvements are recommended.

For the build-out of the site, the new traffic will negatively impact the unsignalized Gate B at S Federal Way intersection. While a traffic signal is not likely to be justified with the new traffic, the delays for the left turning traffic leaving the Micron campus will be high. The following is options are recommended:

- Install traffic signal
- < OR >
- Eliminate left turns leaving Micron's Campus

Memory Road will be extended to the east through a temporary easement to provide construction access to the site. A detailed analysis of construction traffic is not a part of this study. However, since the road does not currently exist, the intersection with S Federal Way will need to be modified. The following is the recommended configuration to accommodate the construction traffic, subject to more detailed analysis:

- Re-configure the southbound approach to the intersection to include a left turn lane
 - Restripe the existing flush median
- Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane

Federal Way at Bergeson Street will degrade to an overall v/c ratio of 0.95. As discussed above, no additional improvements are recommended.

The recommendations for mitigation to the impacts identified above are summarized in the table that follows. In general, the impacts from the site are manageable by the roadway network. S Federal Way is primarily utilized by Micron's current operations with a few additional businesses nearby. The four-lane road has capacity to spare and can accommodate the additional load from FAB1. Similarly, the interchange of Eisenman Road and I-84 is underutilized and, based on the proximity of FAB1, should be the primary access point of choice for employees, delivery vehicles, and contractors.

Intersection Mitigation Summary

Int	Intersection	Control	Recommended Improvements		
			2022 Existing Traffic	2025 Traffic	2025 Traffic with Project
3	Memory Rd & Federal Way/I-84 WB Off-Ramp	Side Street Stop	None	None	- Re-configure the southbound approach to the intersection to include a left turn lane - Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane
5	Federal Way at Gate B	Side Street Stop	None	None	Install traffic signal < OR > Eliminate left movement out of Micron's campus
7	Gowen Rd at Technology Way/Grand Forest Dr	Signal	None	None	None
8	Gowen Rd at Federal Way	Signal	None	None	None
10	Gowen Rd at I-84 EB Ramp	Signal	None	None	None
15	Federal Way at Amity Rd	Signal	- Add a right-turn overlap signal for the westbound right turns - Construct dual southbound left turn lanes - Add 1000 foot receiving lane east of the intersection - Reconfigure the southbound left turn signal for protected-only operation - Reconfigure the northbound left turn signal for permitted operation - Remove the split-phased operation and retime signal	No additional improvements	No additional improvements
16	Federal Way at Bergeson Ave	Signal	- Add a channelizing island for the westbound right turn movement - Add a right-turn overlap signal for the westbound right turn movement - Extend the left turn lane on Bergeson to a total of 500 feet - Change the eastbound left-thru lane to an exclusive left turn lane - Remove the split-phased operation and retime signal	No additional improvements	No additional improvements

The following table shows the new site traffic at each intersection as a percentage of total volume.

No.	Intersection	AM	PM
1	Eisenman Rd at I-84 EB Ramp	59.7%	45.1%
2	Eisenman Rd at I-84 WB On-Ramp	71.2%	57.2%
3	Memory Rd at Federal Way/I-84 WB Off-Ramp	80.8%	63.3%
4	Federal Way at Gate C	77.3%	62.7%
5	Federal Way at Gate B	17.7%	15.2%
6	Federal Way at Silicon Ln	12.9%	9.9%
7	Gowen Rd at Technology Way/Grand Forest Dr	8.5%	6.0%
8	Gowen Rd at Federal Way	6.6%	4.6%
9	Gowen Rd at I-84 WB Ramp	6.1%	3.7%
10	Gowen Rd at I-84 EB Ramp	6.2%	3.5%
11	Technology Way at Circuit Ln	16.3%	15.6%
13	Federal Way at Gate A	28.6%	25.7%
14	Gowen Rd at Warm Springs Ave	11.4%	7.3%
15	Federal Way at Amity Rd	3.0%	2.0%
16	Federal Way at Bergeson Ave	1.1%	0.8%

Proposed Development

The Micron R&D facility located along S. Federal Way in Boise, ID will be the site of a new Fab (an advanced memory fabrication facility). The facility, called FAB1, will utilize both undeveloped and developed area within Micron's larger campus. In conjunction with FAB1, a new childcare facility will be constructed along S. Federal Way, opposite Gate A. The childcare facility is not part of this study but is considered in the future build traffic volume and analysis. A separate, limited traffic study was conducted for the childcare facility.

FAB1 includes several buildings. The primary structure will be a manufacturing facility that includes an approximately 600,000 square foot "clean" room plus support spaces. To support the Fab, there will be utility buildings, administration buildings, and a vendor/contractor support facility along with parking structures and surface lots. FAB1 will support approximately 2000 new Micron employees plus 750 new onsite vendor/contractor employees. For the purposes of this study, the entire FAB1 development will be considered a manufacturing facility with 2,750 employees.

FAB1 is expected to commence limited operation in the end of the second quarter of 2024, and be fully operational with the full complement of employees by 2025.

The following intersections and road segments (as illustrated in Figure 1) are included in this study:

- Intersections
 1. Eisenman Rd & I-84 EB Ramp
 2. Eisenman Rd & I-84 WB On-Ramp
 3. Memory Rd & S Federal Way/I-84 WB Off-Ramp
 4. S Federal Way & Gate C / Gigabit Ln (signal)
 5. S Federal Way & Gate B
 6. S Federal Way & Silicon Way
 7. Gowen Road & Technology Way (signal)
 8. Gowen Road & S Federal Way (signal)
 9. Gowen Road & I-84 WB Ramp (signal)
 10. Gowen Road & I-85 EB Ramp (signal)
 11. Technology Ln & Circuit Way
 12. ~~Memory Rd & Construction Access Road~~ (not studied)
 13. S Federal Way & Gate A / Childcare Center
 14. Gowen Road & Warm Springs Ave
 15. Federal Way & Amity Rd (signal)
 16. Federal Way and Bergeson St (signal)

- Segments
 - A. S Federal Way, South of Silicon Way
 - B. Gowen Road, Btwn S Federal Way and Technology Way
 - C. Memory Road, Btwn I-84 WB On-Ramp and Federal Way
 - D. Technology Way, Btwn Gowen Road and Circuit Way

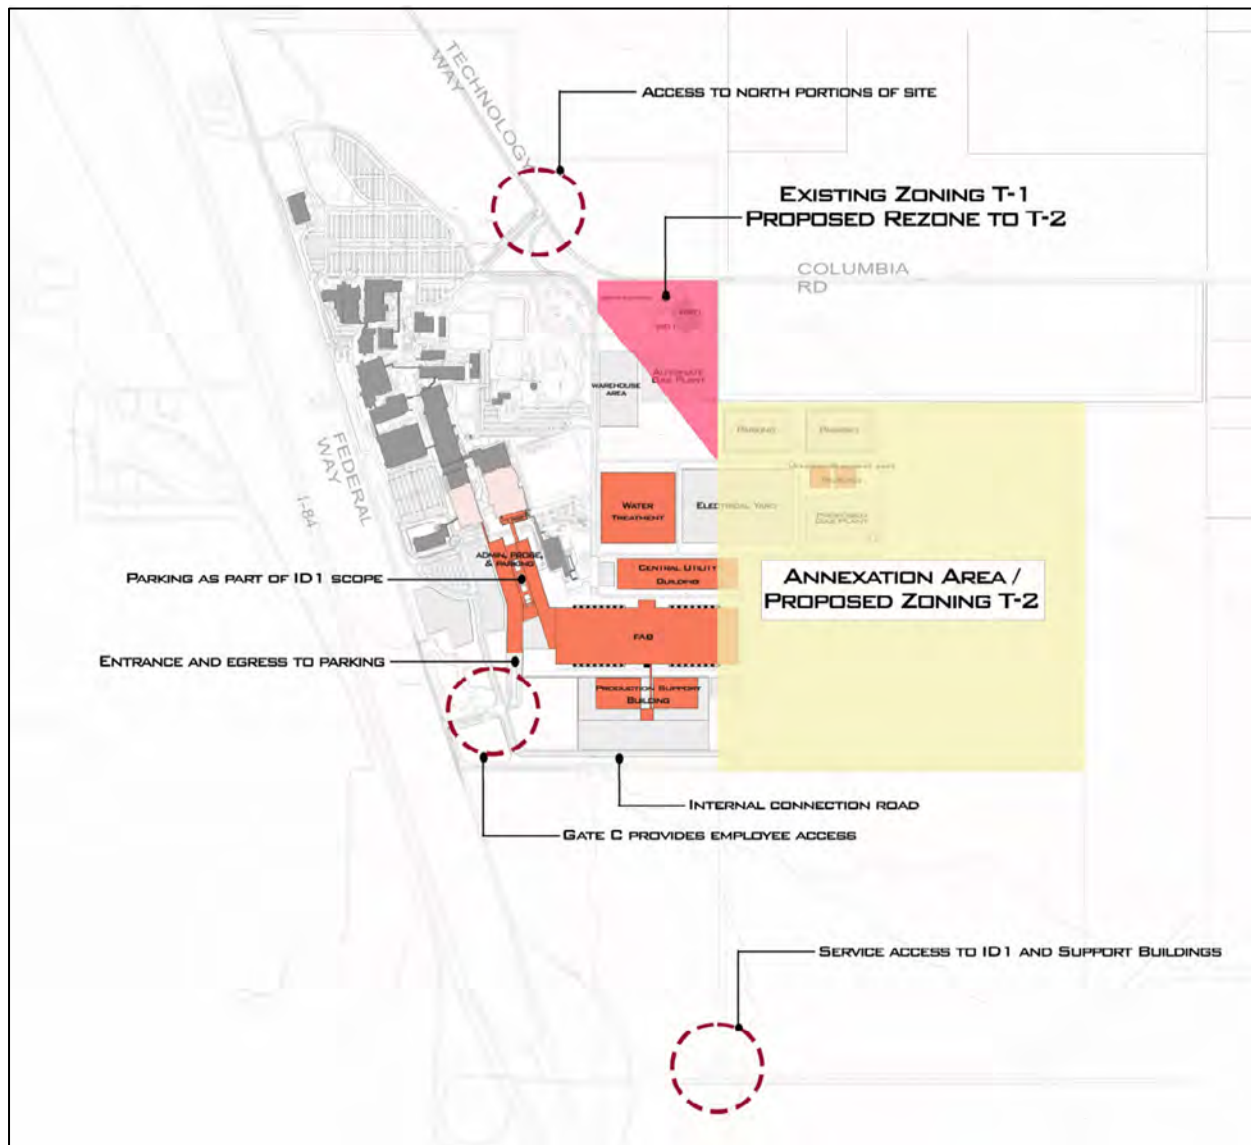

Figure 1 shows the general location of the Fab on Micron's campus. The site plan is shown in Figure 2.

Figure 2. Site Plan

***See Appendix A for a more detailed site plan

Existing Conditions

A.1. Transportation Facilities

A.1.1. Roadways

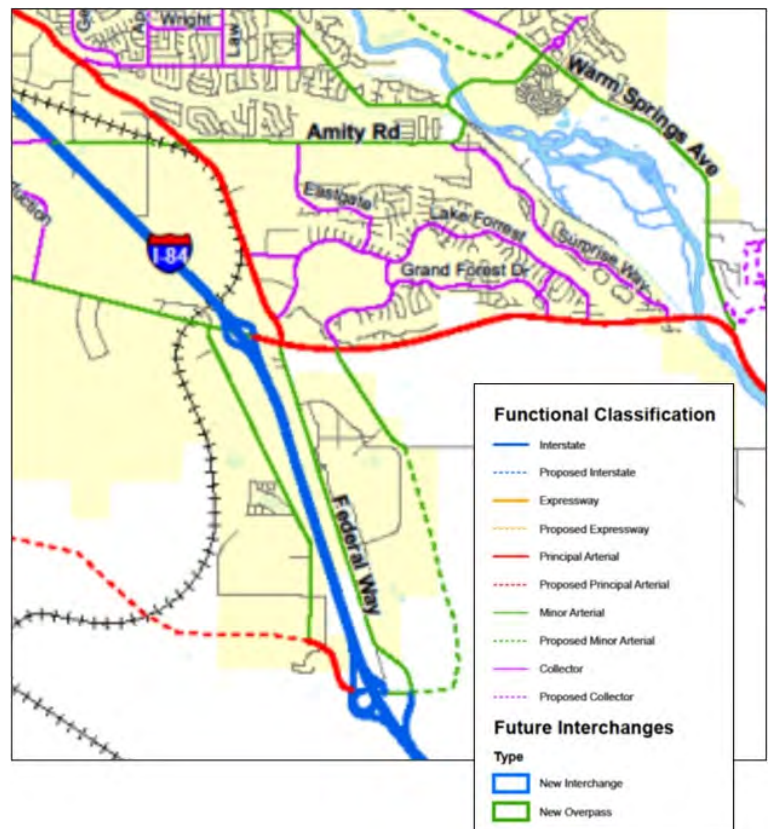

S. FEDERAL WAY is a four-lane arterial with a posted speed limit that varies between 35 and 45 MPH within the vicinity of the study area. The section of S. Federal Way that is south of Gate B is a two-lane divided roadway, and the section between Gate B and Technology Lane has a center two-way left-turn lane. S. Federal Way originates as the north leg of its intersection with Memory Road and the I-84 westbound exit ramp, and heads in a primarily northerly direction, before ending at US 20/26.

The speed limit of S. Federal Way changes to 40 MPH north of its intersection with E. Gowen Road. S. Federal Way is classified as a Minor Arterial roadway south of its intersection with E. Gowen Road. To the north, it is classified as a Principal Arterial roadway. Land uses within the study area are primarily industrial, with residential and commercial uses north of E. Gowen Road.

E. GOWEN ROAD (SH 21) is a four-lane undivided principal arterial with a posted speed limit of 35 MPH near the Micron Campus. The roadway narrows to a two-lane roadway east of its intersection with Technology Way / Grand Forest Drive and the speed limit eventually increases to 55 MPH. Land uses in the study area are industrial, commercial, residential, and undeveloped.

MEMORY ROAD / EISENMAN ROAD is a four-lane undivided Minor Arterial and has a posted speed limit of 35 MPH. Memory Road originates as the west leg of the intersection with S. Federal Way and the I-84 westbound exit ramp and runs west to its intersection with the I-84 westbound ramp where it becomes S. Eisenman Road. There are no developed uses along Memory Road but there is a new convenience store at the corner in the northwest corner of Eisenman Road and the I-84 EB off ramp.

AMITY ROAD is a two-lane undivided Minor Arterial with a posted speed limit of 45 MPH. The road runs east from its intersection with S. Federal Way towards Warm Springs Avenue. Land uses along its length are residential and industrial.

E. WARM SPRINGS AVENUE is a two-lane undivided Minor Arterial roadway with a posted speed limit of 45 MPH. The road runs north from its intersection with SR 21 to the Riverland East and Barber Valley neighborhoods. At the intersection with SH 21, there is a fourth leg that is a maintenance access driveway to a water pump station. This driveway, which has little or no volume, was not factored into the analysis.

E. GRAND FOREST DRIVE AND E. BERGESON STREET are collector roads that lead to several residential developments. They both have a posted speed limit of 30 MPH.

S. GIGABIT LANE (AKA GATE C), TECHNOLOGY LANE (AKA GATE A), SILICON LANE, AND CIRCUIT LANE are private roadways accessing the Micron Facilities.

Table 1: Roadway Classification

Roadway	Segment	Functional Classification
Gowen Rd (SH 21)	I-84 to Warm Springs Rd	Principal Arterial
S. Federal Way	Bergeson Rd to Gowen Rd	Principal Arterial
S. Federal Way	Gowen Rd to Memory Rd	Minor Arterial
Technology Way	Gowen Rd to Circuit Ln	Minor Arterial
Amity Rd	S. Federal Way to Surprise Way	Minor Arterial
Bergeson Rd	S. Federal Way to Apple St	Collector
Grand Forest Dr	Gowen Rd to Gowen Rd	Collector
Warm Springs Rd	Gowen Rd to Eckert Rd	Minor Arterial
Eisenman Rd / Memory Rd	I-84 to S. Federal Way	Minor Arterial
Columbia Rd	Circuit Ln to End	Unclassified / Local Road

A.1.2. Transit Service

There are no fixed-route transit services in the study area that would serve the Micron campus.

A.1.3. Bicycle and Pedestrian Facilities

There are sidewalks/multi-use paths on the south side of Gowen Road (SH 21), west of S. Federal Way; on the north side of Gowen Road between S. Federal Way and Technology Way; on both sides of Federal Way, north of Gowen Road; and, on the east side of S. Federal Way, south of Gowen Road for 1.25 miles.

Gowen Road has bike lanes west of S. Federal Way. S. Federal Way has bike lanes north of Gowen Road and for a few hundred feet south of Gowen Road. Technology Way features a southbound bike lane between Gowen Road and Circuit Lane.

A.1.1. Geometrics

The specific roadway lanes, traffic control, and turn bay lengths are shown in Figure 3. The future extension of Memory Road and the Fab construction access road are shown on the plan for context. Similarly, the access point to the new childcare center opposite Gate A is shown.

A.2. Traffic Volume

Daily (24-hour) counts, and intersection turning movement counts were recorded between 7:00 AM – 9:00 AM and 4:00 PM - 6:00 PM to isolate the AM and PM peak hour conditions. Counts were taken on September 22, 2022 for all locations except at intersection 13. Those counts were taken April 26, 2022 as part of the aforementioned childcare center traffic study. **A single common peak hour was determined for all intersections; the AM Peak Hour is 7:00 to 8:00 am and the PM Peak Hour is between 4:00 and 5:00p.** There are small deviations in the peak hour times from the chosen peak hour along S Federal Way in the vicinity of the Micron campus but the differences are not significant.

There is also an early morning peak between 5:15-6:15 am for Micron but the background traffic is very low. For the purposes of this study, and to be conservative in the results, the site traffic for the new Fab is assumed to be concentrated in the typical AM and PM peak hours.

Existing traffic volumes are shown in Figure 4. The peak hour volumes are shown in Table 2 and the segment volumes are shown in Table 3.

Table 2: Existing Peak Hour Turning Movement Volume

A.3. Existing Levels of Service

The LOS is based on the Highway Capacity Manual (6th Ed.), as calculated in the software Synchro® 11. Table 4 shows the criteria used to determine level of service for signalized, unsignalized, and roundabout intersections. Table 5 shows the level of service criteria for segments as outlined in ACHD standard 7106.4. The values shown are one-way, peak hour volumes.

Table 4: Level of Service Criteria

Level of Service	Average Control Delay		
	Signal	Stop Control	Roundabout
A	0 - 10	0 - 10	0 - 10
B	>10 - 20	>10 - 15	>10 - 15
C	>20 - 35	>15 - 25	>15 - 25
D	>35 - 55	>25 - 35	>25 - 35
E	>55 - 80	>35 - 50	>35 - 50
F	>80	>50	>50

Table 5: ACHD Segment Capacity Guidelines

Functional Classification		Lanes	Volume Thresholds	
			D	E
Princ. Arterials	No Left-turn Lane	1	600	690
	Continuous TWTL	1	770	880
		2	1,680	1,780
		3	2,560	2,720
	Median Control, Channelized Left-turn Lanes	1	850	920
		2	1,860	1,960
3		2,800	3,000	
Minor Arterials	No Left-turn Lane	1	540	575
	Continuous TWTL	1	675	720
		2	1,395	1,540
		3	2,155	2,370
	Median Control, Channelized Left-turn Lanes	1	710	770
		2	1,465	1,670

Coltrs.	No Left-turn Lane	1	425	525
	Continuous TWTL	1	530	660
		2	1,080	1,250

Many of the analysis parameters are established by ACHD. These are shown in Appendix D. The results of the existing conditions analysis are shown in Table 6. Movements that appear highlighted in red are LOS F and those in orange are LOS E. Table 7 shows the segment analysis for the roadways that are proximate to the development.

*Highest peak hour volume in one direction

A.4. Existing Conditions Mitigation

Federal Way & Amity Road (signal)

Amity Road is uniquely situated in an area that funnels traffic from the east towards Federal Way. There is a large volume of traffic in the AM Peak hour that turns right onto Federal Way towards Boise and the surrounding communities and performs the reverse pattern in the PM Peak hour.

To resolve the PM Peak hour deficiency, adding a southbound left turn lane in the existing gore area is feasible. However, while there are two receiving lanes on Amity Road, one lane is not very long short. This will have the effect of creating an uneven distribution of traffic in the dual left turn lanes. There should be a minimum of 1000 feet of two lanes heading east on Amity Road to make the dual left turns effective.

One possible geometric improvement is to create a free-flow right turn lane in the westbound direction. This would mean adding a receiving lane on Federal Way, north of the intersection for at least 1000 feet. The improvement would require significant work since there is a sidewalk along the east side of Federal Way and a business with limited offset space from the sidewalk. The road would need to be widened on the west side, which would extend the construction limits. While adding a free-flow right turn would allow for acceptable levels of service in the AM Peak Hour, it is a departure

from recent ACHD practice regarding pedestrian safety. Another solution would be to use the time allocated for the southbound left turn and give the westbound right turns an overlap signal.

The greatest inefficiency in the traffic signal is the split-phased operation. Because the west side of the intersection is a very low volume private driveway, it isn't necessary to operate the intersection as split phased. The westbound left turn phase can be eliminated in favor a permissive movement – shared with the westbound thru.

Recommendation(s):

- Add a right-turn overlap signal for the westbound right turns
- Construct dual southbound left turn lanes
 - Add 1000 foot receiving lane east of the intersection
- Reconfigure the southbound left turn traffic signal for protected-only operation
- Reconfigure the northbound left turn traffic signal for permitted operation
- Remove the split-phased operation
- Re-time the traffic signal to account for the added road capacity

There appears to be right-of-way along Amity Road to accomplish the improvements

Federal Way and Bergeson Street (signal)

Similar to Amity Road, Bergeson Street serves a residential area of south Boise with commuter traffic heading towards Federal Way and then north. Unlike the Amity Road intersection, the Bergeson Street intersection already features dual southbound left turn lanes. There is no more room to add additional lanes. In the westbound direction, the right turn lane has a short receiving lane / merge area on Federal Way but the effect on LOS is minimal. Channelizing the right turn with a yield sign would improve the flow of traffic without necessarily affecting pedestrian safety.

Similar to Amity Road, one improvement may be to extend the westbound left to northbound Federal Way acceleration lane and provide a free-flow right turn lane. While this would provide acceptable levels of service for most of movements, it would impact pedestrian safety.

The split-phased signal hinders efficient operations but it is necessary based on the available storage area for westbound left turning traffic. The westbound left turn movement could be separated from the thru movement by extending the storage length on Bergeson to 500 feet. This would allow the right turning traffic to slip by when the left turn lane is backed up. The left turn lane should be the terminus of the westbound Bergeson Street traffic (i.e., the main flow lane) and the through lane and right turn lane would be created to the side. While there is a delay for the southbound left turn (LOS E), the recommended improvements, combined with the necessary signal re-timing, will bring the intersection to acceptable levels of service.

- Add a channelizing island for the westbound right turn movement
- Add a right-turn overlap signal for the westbound right turn movement

- Extend the left turn lane on Bergeson by 250 feet to a total of 500 feet to allow for thru and right turning vehicles to bypass the queue
- Change the eastbound shared left-thru lane to an exclusive left turn lane
- Remove the split-phased operation
- Re-time the traffic signal to account for the added road capacity

There appears to be sufficient right-of-way to accomplish the improvements

A.5. Safety Analysis

The most current crash data (2017-2021) as documented by the Local Highway Technical Assistance Council (LHTAC) website (<http://gis.lhtac.org/safety/>) was reviewed and is summarized at each of the study intersections and road segments. (See Table 9.) Appendix F includes a more detailed account of crash types at each intersection and road segment. None of the study intersections have crash rates higher than 1.0. No mitigation has been identified.

Figure 5. Illustration of Crashes within Study Area

A.6. Data Sources

Traffic counts were collected by Quality Counts, Inc. under contract to NV5. Roadway geometrics were observed by a site visit and field measurements. Level of Service criteria is from in the Highway Capacity Manual, 6th Ed, as shown in Table 4. Segment LOS is from ACHD 7106.4.1 Table 2. Crash data is reported by the Idaho Local Highway Technical Assistance Council. Annual average daily volume used in the calculation of crash rates are provided by ITD AADT on-line reference.

Background Conditions

B.1. Planned Roadway and Approved Development Projects

There is a planned connector road in the Capital Improvement Plan (CIP). The road would go between Memory Road and Columbia Road with a traffic signal on Columbia Road. The alignment of the road has not been determined and no plans currently exist. The road was not considered for this traffic study since the CIP indicates the project will be built in the 2036 to 2040 timeframe.

B.2. Background Data

Future 2025 turning movement conditions were forecast utilizing localized growth rates as provided by COMPASS. Table 10 shows the growth changes from the COMPASS model. Figure 6 shows the recommended annual growth rates for each corridor. These annual rates were applied to existing traffic counts for three years to determine future year background traffic conditions. No other background projects were considered.

Table 10: Growth Rates

Location	2025	2030	Calculated Growth	COMPASS Rate*	Growth Factor 2022-2025

*Highest peak hour volume in one direction

B.4. Background Growth Conditions Mitigation

Federal Way and Bergeson Street (signal)

With the improvements identified for the existing conditions deficiency, the overall volume to capacity will still degrade to 0.94 in the future condition with the project background growth. Per ACHD policy, any value 0.90 or greater must be mitigated even though the overall level of service is a D.

A multi-lane roundabout at this location would not work. Besides being very large and requiring more right-of-way than is available, the amount of traffic would exceed the capacity of a two-lane roundabout with right turn by-pass lanes. While dual westbound left turn lanes might be constructable, the v/c ratio would be unchanged.

The high volume of traffic necessitates three thru lanes in each direction on Federal Way to obtain. The v/c ratio could be reduce to 0.88 but the alternative is not a feasible alternative since there is limited right of way available and a large grade difference in the northeast quadrant of the intersection.

Recommendation(s):

- o Same configuration as in Existing Conditions mitigation

Table 13 shows the results of mitigation from both the existing conditions improvements (see Section A.4) and the background growth conditions.

B.5. Data Sources

COMPASS supplied the forecasts for 2025 and 2030 PM peak hour traffic. No other approved developments were provided or incorporated into the projections for 2025 'no-build' analysis.

Projected Traffic

C.1. Project Trip Generation

The development will include 2,000 new Micron associates plus 750 “sustaining” contractors. Because there are several buildings that are needed to support the operation but a total of 2750 employees, “Manufacturing” using an independent variable of number of employees is the appropriate land-use category. The number of trips generated by the proposed development was estimated using the equations provided in the ITE Trip Generation Manual, 11th Edition. The following table provides a summary of these results for daily, AM peak hour, and PM peak hour conditions. The land-use does not include separate values for pass-by traffic or internal trips and was not accounted for in this study.

Table 14: Trip Generation

Land Use	Trips	Daily	AM			PM		
			In	Out	Total	In	Out	Total
Manufacturing (LU 140) 2,750 Employees*	Auto	5,661	487	173	660	215	370	585
	Trucks	513	16	13	29	11	15	26
	Total	6,174	503	186	689	226	385	611

*includes sustaining contractors

C.2. Trip Distribution and Assignment

The assignment and directional distribution of new project trips on the transportation network are based on the expected facility’s employment service areas, population density in Boise, ID, and input from COMPASS. The home cities of current employees are shown in Figure 8. Truck distribution is based on the expected outlets to interstate travel. The intersection-specific percentages and assignment of the site trips are shown in Figures 10 through 13.

Figure 8. Existing Employee Home Origins

Traffic Analyses

D.1. Build Condition Capacity Analysis

The results of build conditions capacity for intersection (2022 volumes plus background growth plus site traffic) are shown in Table 15 and include the analysis of the volumes shown in Figure 13.

D.2. Build Conditions Mitigation

Memory Rd at I-84 WB Off-Ramp

The intersection geometry is unique to the traffic conditions. There is currently no east side of the intersection so the eastbound left turning traffic (i.e., traffic heading north on S Federal Way) can move unimpeded. Only the northbound traffic coming from I-84 is stopped and that volume is projected to be manageable. HCM 6th Ed. does not include the ability to analyze the intersection in its current form but can if a dummy link is added to the east side of the intersection.

If Memory Road is to be used as a construction traffic route for FAB1, the intersection at S Federal Way will need to be reconfigured. At a minimum, the southbound movement on S Federal Way will need a left turn lane. Memory Road Ext will need one lane leaving and one lane entering the construction area. The analysis of construction period traffic is not included in this study but will be a separate effort. The intersection may need to be signalized if the construction traffic analysis shows a significant and sustained volume of traffic to/from the construction site.

Recommendation(s):

- Re-configure the southbound approach to the intersection to include a left turn lane
- Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane
- Consider a construction-era traffic signal if volumes are significant

S Federal Way & Gate C / Gigabit Lane (signal)

Gate C will serve as the primary access for the parking lots on the south side of the Micron campus – which is where most of the parking will be located. The FAB1 development and most of the parking will have direct access to Gate C and easy access to the Eisenman interchange with I-84. The intersection has ample capacity to accommodate the future traffic primarily because it is signalized and the volume on S Federal Way is low.

S Federal Way & Gate B

Gate B is the next closest access point for the parking lots on the southern end of the Micron campus. Currently, during shift change, there is a large volume of traffic leaving Gate B but almost all of it makes a right turn and heads north on S Federal Way. Conversely, in the AM peak hour, there is a large volume of southbound left turning vehicles entering the site. The intersection is stop controlled and already experiences some delays for left-out traffic. The additional load from FAB1 traffic will overburden the intersection. A traffic signal may be needed but does not meet the required MUTCD volume criteria. (See Section D.3. for a signal warrant discussion.)

Recommendation(s):

- Consider a traffic signal (subject to warrant analysis) to accommodate site traffic demands
- If a traffic signal is not allowed, eliminate the left turns out of the Micron campus
 - This would force traffic leaving the campus heading south to use Gate A or Gate C.
 - The additional traffic load on the signal at Gate C would not degrade the level of service at that intersection. (See Appendix E – Mitigation Section)

Federal Way and Bergeson Street (signal)

With additional project traffic, the v/c ratios will worsen slightly. The solutions discussed and discarded for existing and for background conditions were analyzed but with additional traffic, there

were found to be unacceptable. Given the adequate levels of service with the recommended mitigation from the existing conditions, those are the best solutions for the build traffic conditions.

Recommendation(s):

- o Same configuration as in Existing Conditions mitigation

Table 17 shows the results of mitigation from the existing conditions improvements (see Section A.4) the background growth conditions improvements (see Section B.4) and the build conditions improvements.

Conclusions and Recommendations

E.1. Capacity Analysis Conclusions

An analysis of the v/c ratios, LOS, delay, and expected queuing results in a series of conclusions for each intersection. These are described in detail below.

E.1.1. Eisenman Road & I-84 EB Ramp

The intersection has ample capacity to accommodate the future traffic.

E.1.2. Eisenman Road & I-84 WB On-Ramp

While HCM 6th Ed. lacks the research to make the capacity calculations, an evaluation of the volume of traffic shows that the intersection can accommodate future traffic. The additional westbound traffic on Eisenman Road should pose no significant delay for eastbound left turning traffic.

E.1.3. Memory Road & S Federal Way/I-84 WB Off-Ramp

Build Conditions Recommendation(s):

- Re-configure the southbound approach to the intersection to include a left turn lane
- Configure the east side of the intersection to include a shared thru-right lane in the westbound direction and a single eastbound lane
- Consider a construction-era traffic signal if volumes are significant

E.1.4. S Federal Way & Gate C / Gigabit Lane (signal)

Gate C will serve as the primary access for the parking lots on the south side of the Micron campus – which is where most of the parking will be located. The FAB1 development and most of the parking will have direct access to Gate C and easy access to the Eisenman interchange with I-84. The intersection has ample capacity to accommodate the future traffic primarily because it is signalized and the volume on S Federal Way is low.

E.1.5. S Federal Way & Gate B

Build Conditions Recommendation(s):

- Consider a traffic signal (subject to warrant analysis) to accommodate site traffic demands
- If a traffic signal is not allowed, eliminate the left turns out of the Micron campus
 - This would force traffic leaving the campus heading south to use Gate A or Gate C.
 - The additional traffic load on the signal at Gate C would not degrade the level of service at that intersection. (See Appendix E – Mitigation Section)

E.1.6. S Federal Way & Silicon Way

The intersection has ample capacity to accommodate the future traffic.

E.1.7. Gowen Road & Technology Way (signal)

The intersection meets the minimum standards established by ACHD; no improvements are recommended.

E.1.8. Gowen Road & Federal Way (signal)

The intersection meets the minimum standards established by ACHD; no improvements are recommended.

E.1.9. Gowen Road & I-84 WB Ramp (signal)

The intersection meets the minimum standards established by ACHD; no improvements are recommended.

E.1.10. Gowen Road & I-85 EB Ramp (signal)

The intersection meets the minimum standards established by ACHD; no improvements are recommended.

E.1.11. Technology Lane & Circuit Way

The intersection has ample capacity to accommodate future traffic.

~~E.1.12. Memory Road Ext & Construction Access Road (not studied)~~

E.1.13. Federal Way & Gate A / Childcare Center

This intersection was studied in detail in a separate report for the childcare center development. While the new Fab traffic will contribute more traffic on S Federal Way, it will not be enough to justify a traffic signal once the new childcare center is operational. There is additional land yet to be developed on the west side of S Federal Way that will share the access point. This intersection should be monitored for the need for a traffic signal as more development occurs. **No improvements are recommended.**

E.1.14. Gowen Road & Warm Springs Avenue

The intersection has ample capacity to accommodate future traffic.

E.1.15. Federal Way & Amity Road (signal)

Existing Conditions Recommendation(s):

- Add a right-turn overlap signal for the westbound right turns
- Construct dual southbound left turn lanes
 - Add 1000 foot receiving lane east of the intersection
- Reconfigure the southbound left turn traffic signal for protected-only operation
- Reconfigure the northbound left turn traffic signal for permitted operation
- Remove the split-phased operation
- Re-time the traffic signal to account for the added road capacity

E.1.16. Federal Way and Bergeson Street (signal)

Existing Conditions Recommendation(s):

- Add a channelizing island for the westbound right turn movement
- Add a right-turn overlap signal for the westbound right turn movement
- Extend the left turn lane on Bergeson to a total of 500 feet to allow for thru and right turning vehicles to bypass the queue
- Change the eastbound shared left-thru lane to an exclusive left turn lane
- Remove the split-phased operation
- Re-time the traffic signal to account for the added road capacity

Background Traffic Conditions Recommendation(s):

- Same as Existing Conditions

Build Traffic Conditions Recommendation(s):

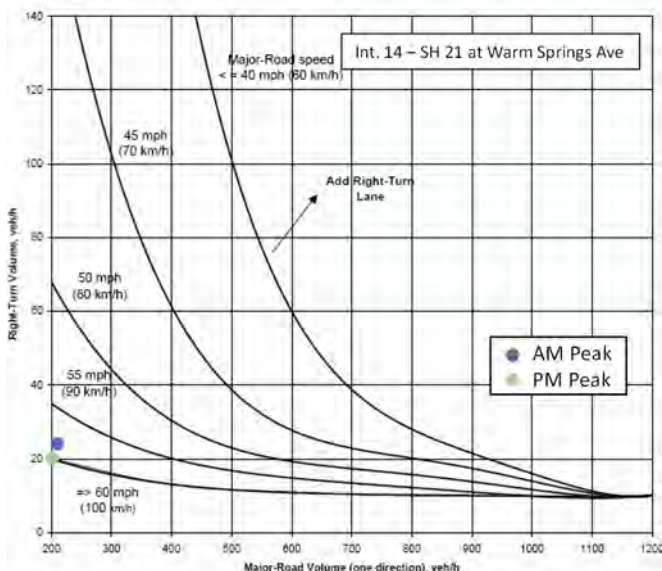

- Same as Existing Conditions

E.2. Driveway Analysis

There are four access points to the Micron study within the study area: Federal Way at Gate A, Gate B, and Gate C and Technology Way at Circuit Lane (aka Gate D). All of these access points have left turn lanes. Gates A and B do not have right turn deceleration lanes, however the northbound left turn volume into these driveways is very low. The only other unsignalized study intersection where a turn lane does not exist is SH 21 at Warm Spring Ave. The charts from ACHD Guideline 7106 (Figures 6 and 7) are shown in Figure 14. None of the analyzed movements meet the requirements for a right turn lane.

Figure 14. Turn Lane Analysis Figures

E.3. Parking Requirements

In order to construct the new Fab and associated office, utility, warehouses, and other ancillary building, the existing parking lot on the south side of the campus will be removed. New parking structures and surface parking lots are planned to be built and have been identified on the site plan. Approximately 3,800 parking spaces will be removed and approximately 7,100 parking spaces will be added with the project (a net change of about 3,300), which will sufficiently serve the new 2,750 employees.

E.4. Signal Warrant Analysis

The unsignalized intersection of **S Federal Way and Silicon Lane** has one movement that will experience an LOS D. In the AM Peak hour, the westbound left turn has LOS D. Per ACHD guidelines, a signal warrant study is required. The 2009 edition of the Manual on Uniform Traffic Control Devices (MUTCD, 2009) were consulted to determine if the intersection would meet the criteria. The side street movements are very low during the peak hours (less than 10 vehicles) and would therefore not meet the standards.

The intersection of **S Federal Way and Gate A** was previously studied for a traffic signal and was denied by ACHD. The warrant study was revisited using additional project volume and a growth rate of 1% per year. Counts were collected for an extended day so new project traffic on the minor streets was estimated based on the daily volume of traffic expected at the intersection times the ratio of existing traffic over the existing daily traffic. In this way, the new daily site volume (accounting for the distribution percentages seen in Figure 10) could be factored into the warrant analysis along with the childcare center traffic. The results of the warrant analysis is shown in Table 18 and in Figure 15. A traffic signal is not warranted at this location.

Table 18: Signal Warrant Analysis Summary – S Federal Way at Gate A / Childcare Center

Hour Beginning			100% Criteria		70% Criteria	
	S Federal Way	Gate A/Childcare Center	Warrant 1		Warrant 1

Number of Hours Met			5	0	10	0
Warrant Satisfied?			NO		NO	

Figure 15. Warrant 2 and 3 Figures – S Federal Way at Gate A / Childcare Center

S Federal Way at Gate B may benefit from a traffic signal. It would reduce the delay for traffic turning left out of the site. Eight hours of traffic volume on the minor street side are not available; however, an analysis of the major street traffic shows that there is not enough traffic to meet the minimum criteria in the MUTCD. Even if the site traffic met the minimum threshold for eight hours of the day, the combination of the main street and minor street traffic would not trigger a need.

The base volume for the north and southbound movements on S Federal Way base volume is from data collected for the signal warrant study for the Gate A intersection and the proposed childcare center. The base volume was multiplied by the growth factor for S Federal Way as shown in Table 7. The 7-9a and 4-6p volumes are from the turning movement traffic counts with the growth factor applied. Future peak hour volumes are from Figure 13 and estimated for shoulder hours. Figure 15 shows the Warrant 2 (four-hour) and Warrant 3 (peak hour) warrant. While the peak hour volume may appear to meet the criteria, it is based primarily on side street right turning traffic which is not a strong justification for a traffic signal.

Table 19: Signal Warrant Analysis Summary – S Federal Way at Gate B

APPENDIX C: Scoping Document

TIS SCOPING MEMO

To: Christy Little, ACHD
From: John Karnowski, PE, PTOE, AICP (john.karnowski@NV5.com)
cc: Heather Baldwin, Micron
 Deborah E. Nelson, Givens Pursley, LLP
Date: October 10, 2022
Re: Traffic Impact Study Scoping Documentation
 Proposed Micron FAB1 Development, S Federal Way, Boise, ID

This memorandum conveys current information related to the preliminary scope of a Traffic Impact Study (TIS) for a microprocessor fabrication facility in Boise, Idaho. The following include trip generation, study area, background growth, nearby approved development, trip distribution and analysis scenarios.

Site Description

The TIS will comply with all the requirements of the ACHD including analysis, reporting, and development of any necessary mitigation measures meeting minimum design Level-of-Service (LOS) D for suburban roadways and intersections. The proposed development will include several buildings in support of the main fabrication building. The buildings will be east of S Federal Way, north of Memory Lane, and west of Columbia Road. There will be multiple points of egress for the development, all of which are existing. Construction traffic will utilize a temporary road, which will be the extension of Memory Lane.

This study will consider only the first phase of development which will be the Fab building, related office and support buildings, and a vendor building. The site location is shown in Figure 1.

Site Access

Access to the site will be available from existing driveways along S Federal Way and Technology Way.

Figure 1. Site Location and Study Area Map

Site Trip Generation

A new manufacturing facility will be built on land adjacent to the existing Micron R&D campus. The development will include 2,000 new Micron associates plus 750 “sustaining” contractors. Because there are several buildings that are needed to support the operation but a total of 2750 employees, “Manufacturing” with an independent variable of number of employees is the more prudent land use category. The number of trips generated by the proposed development was estimated using the equations provided in the ITE Trip Generation Manual, 11th Edition. The following table provides a summary of these results for daily, AM peak hour, and PM peak hour conditions.

Table 1. Trip Generation

Land Use	Trips	Daily	AM			PM		
			In	Out	Total	In	Out	Total
Manufacturing (LU 140) 2,750 Employees*	Auto	5,661	487	173	660	215	370	585
	Trucks	513	16	13	29	11	15	26
	Total	6,174	503	186	689	226	385	611

*includes sustaining contractors

Trip Distribution and Trip Assignment

The assignment and directional distribution of new project trips on the transportation network are based on the expected facility’s employment service areas, population density in Boise, ID, and input from COMPASS. The home locations of current employees is tabulated in Table 2 and shown in Figure 2.

Table 2. Employee Home Base

Current Employee Home City	% of Total
Boise	63%
Meridian	19%
Nampa	6%
Kuna	4%
Caldwell	2%
Eagle	2%
Mountain Home	1%
Middleton	1%
Star	1%
Garden City	0.4%
Emmett	0.4%
Idaho City	0.2%

Figure 2. Employee Home Base

Truck distribution is based on the expected outlets to interstate travel. The intersection-specific percentages and assignment of the site trips are shown in Figures 3-5.

Figure 3. Macro Area Trip Distribution – Autos and Trucks

Study Locations

The following intersections and road segments (as illustrated in Figure 1) will be analyzed:

- Intersections
 1. Eisenman Rd & I-84 SB Ramp
 2. Eisenman Rd & I-84 NB On-Ramp
 3. Memory Ln & Federal Way/I-84 NB Off-Ramp
 4. Federal Way & Gate C (signal)
 5. Federal Way & Gate B
 6. Federal Way & Silicon Way
 7. Gowen Road & Technology Way (signal)
 8. Gowen Road & Federal Way (signal)
 9. Gowen Road & I-84 NB Ramp (signal)
 10. Gowen Road & I-85 SB Ramp (signal)
 11. Technology Ln & Circuit Way
 - ~~12. Memory Ln & Fab Access Road~~
 13. Federal Way & Gate A / Childcare Center
 14. Gowen Road & Warm Springs Ave
 15. Federal Way & Amity Rd (signal)
 16. Federal Way and Bergeson St (signal)
- Segments
 - A. Federal Way, South of Silicon Way
 - B. Gowen Road, Btwn I-84 NB Ramp and Federal Way
 - C. Memory Ln, Btwn I-84 NB On-Ramp and Federal Way
 - D. Technology Way, Btwn Gowen Road and Circuit Way
 - E. Columbia Road, east of Circuit Way

Traffic Counts

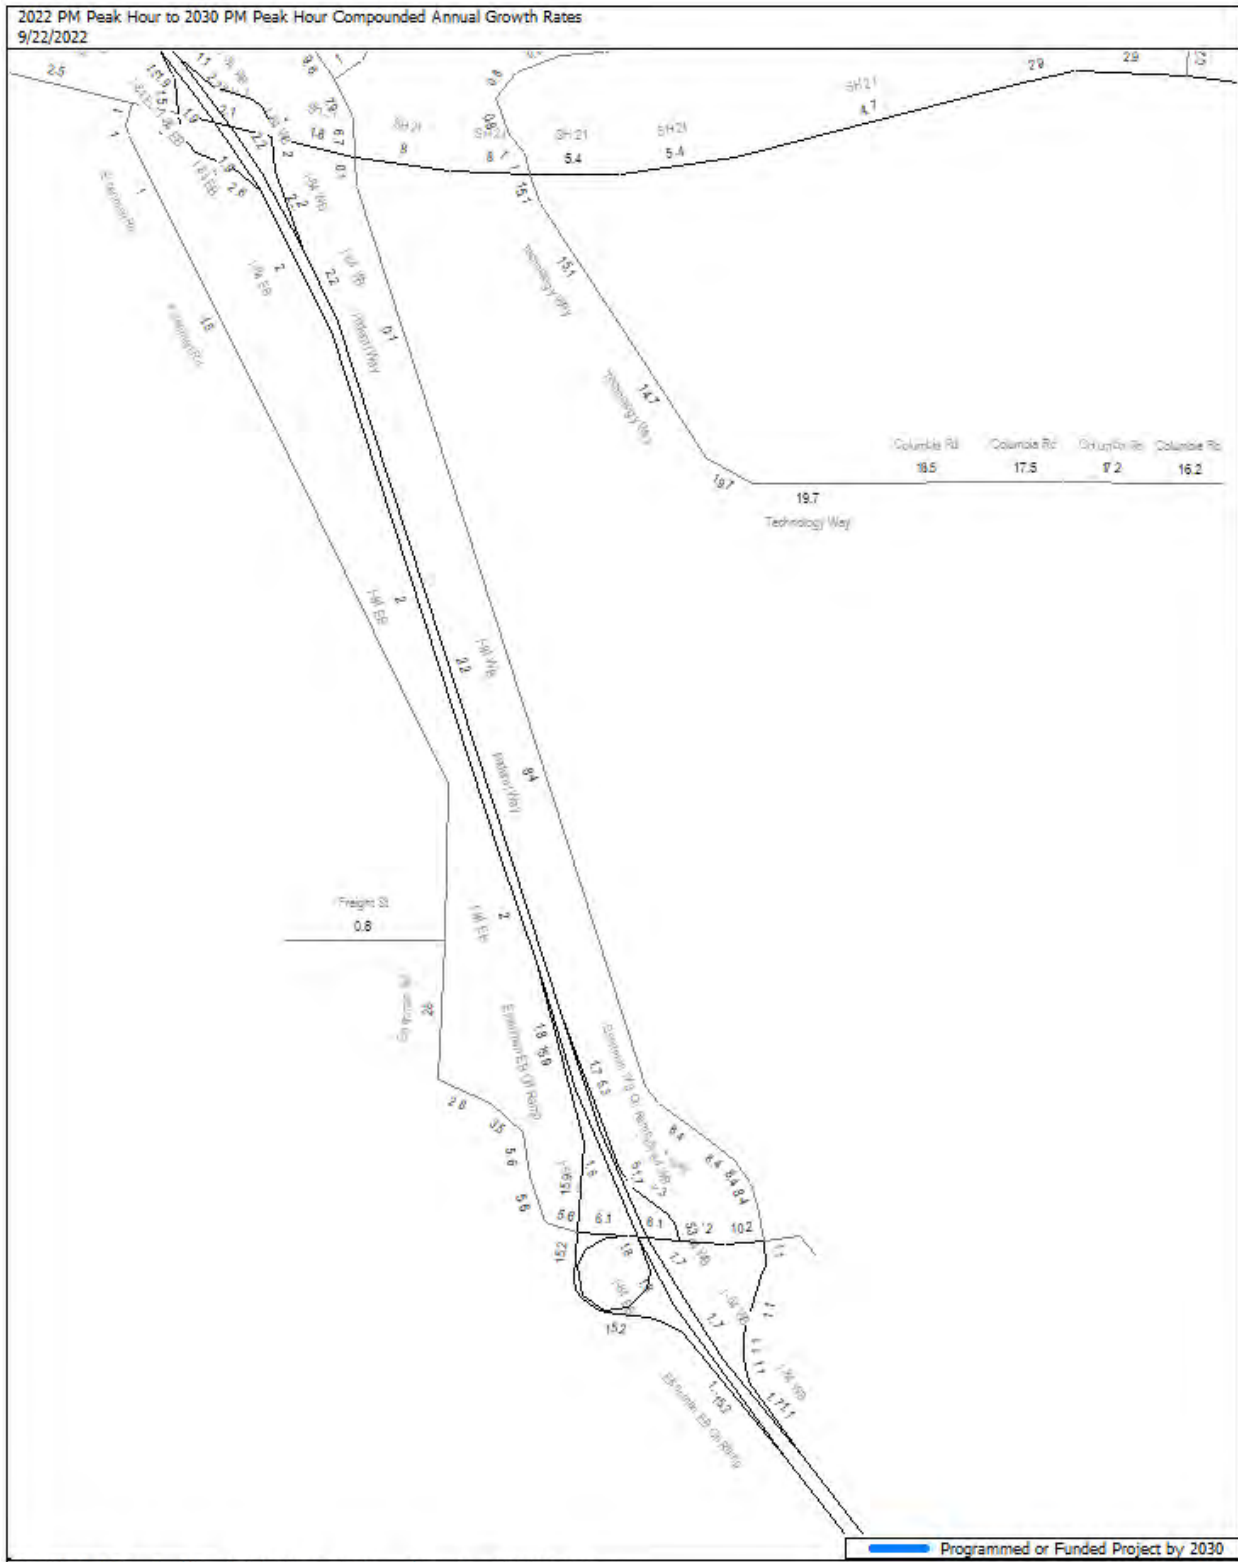

Daily (24-hour) counts, and Intersection turning movement counts will be recorded between 7:00 AM – 9:00 AM and 4:00 PM - 6:00 PM to isolate the AM and PM peak hour conditions. Based on previous traffic counts, the AM Peak Hour is generally between 7:45 and 8:45 am. The PM Peak Hour is between 4:15 and 5:15p. There is also an early morning peak between 5:15-6:15 am for Micron but the background traffic is very low.

Background Growth

Future 2025 turning movement conditions will be forecast utilizing growth rates provided by COMPASS. Table 3 shows the growth changes from the COMPASS model. Figure 7 shows the annual growth rates for each corridor. These rates will be applied to existing traffic counts for three years to determine future year background traffic conditions. No other background project traffic will be considered.

Location	2022-2030 Annual Growth	Growth Factor 2022-2025
SH 21 w/o Eisenman Rd	2.5%	1.08
SH 21 w/o Federal Way	1.6%	1.05
SH 21 e/o Federal Way	8.0%	1.26
SH 21 e/o Technology Way	5.4%	1.17
SH 21 w/o Warm Springs	2.9%	1.09
Federal Way s/o SH 21	1.0%	1.00
Federal Way n/o Yamhill Rd	9.6%	1.32
Technology Way, s/o SH 21	15.1%	1.52
Columbia Rd e/o Circuit Way	19.7%	1.72
Eisenman Pkwy/Memory Ln	6.1%	1.19

Figure 7. COMPASS 2022 to 2030 Compounded Annual Growth Rates

Signal Warrants

Signal warrant analysis will be performed for any intersection that is found to exceed ACHD's acceptable v/c ratio of 1.0 in the analysis.

Planned Roadway & Approved Development Projects

There is a planned connector road in the Integrated Five-Year Work Plan (2022-2026). The road would go between Memory Lane and Columbia Road. The alignment of the road has not been determined and no plans current exist. The road will not be considered for this traffic study. Also in the IFYWP is a future widening of Amity Road but the date of such a widening appears to be well into the future.

Analysis Scenarios

Capacity analyses will be completed utilizing Synchro 11® and *Highway Capacity Manual, 6th Edition* methodology. All study intersections will be analyzed during the surrounding roadways' weekday AM and PM peak hours under the following traffic scenarios:

- Existing (2022) Traffic Volume and Roadway Conditions
- Existing + Background Growth (2025) with Existing Roadway Conditions
- Existing + Background (2025) + Phase 1 Build with Existing Roadway Conditions

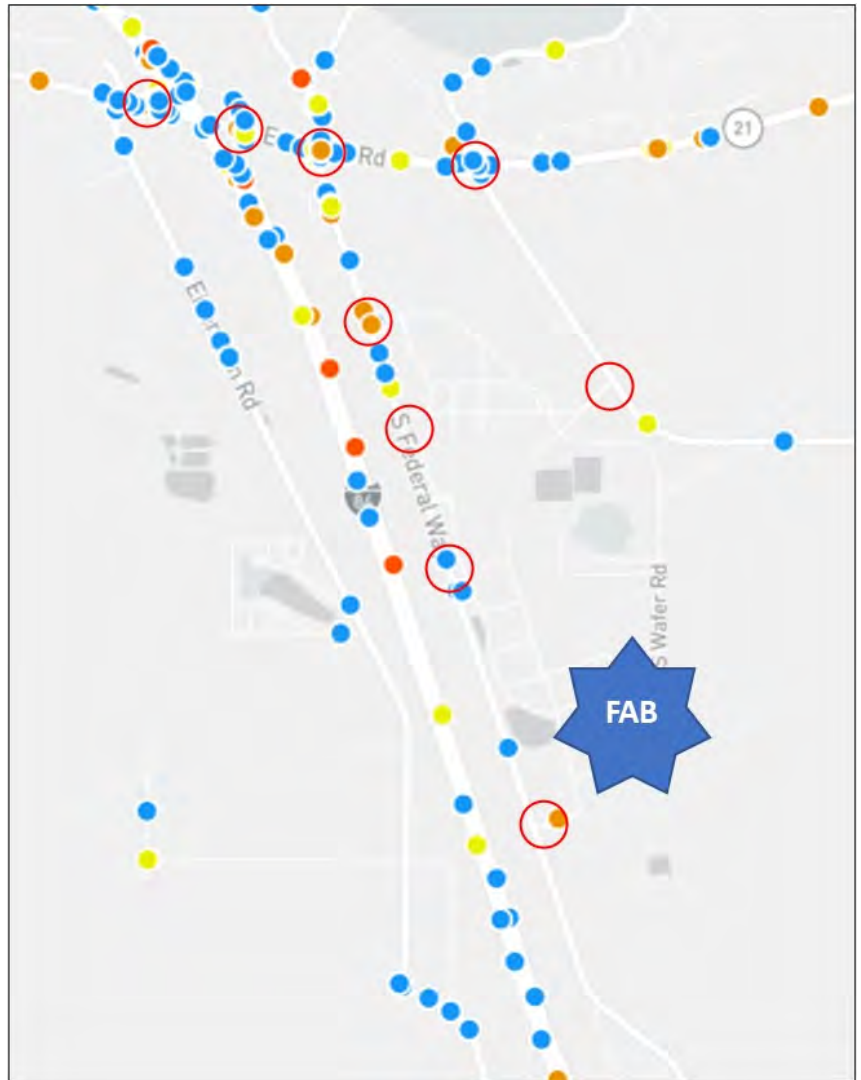

Traffic Operations and Safety Review

The most current crash data (2017-2021) as documented by the Local Highway Technical Assistance Council (LHTAC) website (<http://gis.lhtac.org/safety/>) will be reviewed and summarized at each of the project area intersections. If certain crash trends exist, they will be noted along with possible countermeasure improvements that could be implemented to reduce crash frequency. A further safety review at these locations will not be completed.

A traffic operations review will be performed at the previously noted intersections using Synchro 11 software. In accordance with ACHD Policy, the maximum overall intersection v/c ratio is 0.90 for signalized intersections while the maximum lane group v/c ratio for signalized and unsignalized intersections is 1.0, and 0.85 for roundabouts. Default values as summarized in Policy 7106.6 will be assumed.

Roadway segments will be evaluated using the ACHD LOS Planning Threshold table. Based on the current ACHD Policy Manual, the minimum acceptable LOS for a roadway segment is LOS E for principal arterials and minor arterials, and LOS D for collectors.

Driveway locations will be reviewed to determine if ACHD Access Spacing Policy is met. Additionally, a turn lane analysis in accordance with NCHRP 457 will be performed at the site access points to determine if auxiliary right and left turn lanes are warranted.

Study Area Crashes – 2017-2021 (Source LHTAC)

Report

The TIS report will be prepared with adherence to TIS requirements found in the ACHD General Requirements and Procedures for Development except as may be deviated by this document.

Construction Period Traffic

In a separate analysis and memo, the construction traffic will be assessed relative to the plans and recommendations identified in the TIS. The number of construction vehicles and contractor private vehicles – over time – will be estimated and the expected distribution and relative impacts will be considered. Graphics showing the volume of traffic through the study area will be included in the technical memo. No detailed capacity analysis will be performed unless the volume of traffic appears to be concentrated in any one area and believed to cause problems. In that case, limited capacity analysis will be performed to determine possible construction-time period mitigation.

APPENDIX D: Highway Capacity Worksheets

The following is the required setup for capacity analysis per ACHD guidelines. These were followed, as applicable, in the Synchro analysis.

Variable	Existing Analysis	Future Year Analysis
HCS Analysis Type ¹	Operations	
HCS Report Type	Full Report and Back of Queue Worksheets or Long Report	
HCM Analysis Duration	0.25 hours	
PHF	Actual by approach	0.90 ²
RTOR	Actual count or 0	Existing percentage or 0
Unit Extension	3 sec	
Arrival Type	HCM Exhibit 10-18	
Start Up Time	2 sec	
Extension of Effective Green Time	2 sec	
Walking Speed	4 ft/sec ³	3.5 ft/sec ³
Pedestrian Volume	Actual count or 400 CBD or 50 non-CBD	
Pedestrian Travel Distance	Distance from top of ramp to opposite curb	
Lane Utilization Factor	HCM Exhibit 10-23	
Phasing	Existing	Leading/Protected left turns
Actuation Type	Existing	Fully actuated except Boise CBD
Cycle Length	Use Cycle Length from Table	
Base (Ideal) Saturation Flow Rate	1800	
Lane Width Existing	Existing	Existing ⁴
% Heavy Vehicles	Existing %	
% Grade	Existing %	
Parking maneuvers per hour	HCM Exhibit 10-20	
Bus Stops per hour	HCM Exhibit 10-21	
Yellow Time	4 sec 40 mph and under; 5 sec over 40 mph	
Red Time	1 sec	
Min Vehicle Green Time	5 sec	
Min Pedestrian Green Time	5 sec	
Upstream filtering adjust factor	HCM Exhibit 15-7 5	

¹The preferred software is the latest version of the HCS or Synchro.

²Use existing PHF if existing PHF is > 0.90 and no capacity improvements are planned.

³Use walking speed of 3 ft/sec around certain land uses such as schools.

⁴Use ACHD Policy Manual if improvements will be completed by analysis year.

⁵Use value of 1.0 if nearest upstream signal is greater than 1/2 mile away.

Intersection Summary

Area Type:	Other
Cycle Length:	110
Actuated Cycle Length:	110
Offset:	32 (29%), Referenced to phase 2:NBTL and 6:SBT, Start of Green
Natural Cycle:	135
Control Type:	Actuated-Coordinated
Maximum v/c Ratio:	2.70
Intersection Signal Delay:	103.2
Intersection LOS:	F
Intersection Capacity Utilization	56.2%
ICU Level of Service	B
Analysis Period (min)	15
~	Volume exceeds capacity, queue is theoretically infinite. Queue shown is maximum after two cycles.
#	95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
m	Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other
 Cycle Length: 190
 Actuated Cycle Length: 190
 Offset: 0 (0%), Referenced to phase 2:WBTL and 6:EBT, Start of Green
 Natural Cycle: 60
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.96
 Intersection Signal Delay: 44.6
 Intersection LOS: D
 Intersection Capacity Utilization 78.5%
 ICU Level of Service D
 Analysis Period (min) 15
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other
 Cycle Length: 130
 Actuated Cycle Length: 130
 Offset: 126 (97%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green
 Natural Cycle: 145
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 1.08
 Intersection Signal Delay: 55.7
 Intersection LOS: E
 Intersection Capacity Utilization 71.5%
 ICU Level of Service C
 Analysis Period (min) 15
 ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other
 Cycle Length: 110
 Actuated Cycle Length: 110
 Offset: 32 (29%), Referenced to phase 2:NBTL and 6:SBT, Start of Green
 Natural Cycle: 135
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 3.36
 Intersection Signal Delay: 141.1
 Intersection LOS: F
 Intersection Capacity Utilization 68.8%
 ICU Level of Service C
 Analysis Period (min) 15
 ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other
 Cycle Length: 190
 Actuated Cycle Length: 190
 Offset: 0 (0%), Referenced to phase 2:WBTL and 6:EBT, Start of Green
 Natural Cycle: 60
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.98
 Intersection Signal Delay: 47.5
 Intersection LOS: D
 Intersection Capacity Utilization 81.3%
 ICU Level of Service D
 Analysis Period (min) 15
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other
 Cycle Length: 130
 Actuated Cycle Length: 130
 Offset: 126 (97%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green
 Natural Cycle: 145
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 1.32
 Intersection Signal Delay: 109.4
 Intersection LOS: F
 Intersection Capacity Utilization 89.8%
 ICU Level of Service E
 Analysis Period (min) 15
 ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

HCM 6th Ctrl Delay	23.0
HCM 6th LOS	C

Notes

- User approved pedestrian interval to be less than phase max green.
- User approved volume balancing among the lanes for turning movement.
- Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

HCM 6th Ctrl Delay	29.6
HCM 6th LOS	C

Notes

- User approved pedestrian interval to be less than phase max green.
- User approved volume balancing among the lanes for turning movement.
- Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

HCM 6th Ctrl Delay	27.8
HCM 6th LOS	C

Notes

- User approved pedestrian interval to be less than phase max green.
- User approved volume balancing among the lanes for turning movement.
- Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

HCM 6th Ctrl Delay	27.7
HCM 6th LOS	C

Notes

- User approved pedestrian interval to be less than phase max green.
- User approved volume balancing among the lanes for turning movement.
- Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

HCM 6th Ctrl Delay	38.6
HCM 6th LOS	D

Notes

- User approved pedestrian interval to be less than phase max green.
- Unsignalized Delay for [WBR] is excluded from calculations of the approach delay and intersection delay.

**K = DHV / AADT

***V = Intersection Peak Volume / K

Crashes for spots (such as intersections) are normally expressed in terms of crashes per million entering vehicles (MEV). Use the following formula:

$$R = (A \times 10^6) / (365 \times T \times V)$$

where,
R = crash rate
A = number of reported crashes
T = time period of the analysis in years
V = daily entering volume at the intersection

Segment Crash Rates

*Source: Idaho AADT ArcGIS map, 2021 volumes

Crashes for roadway segments are normally expressed in terms of crashes per 100 million vehicle-miles (100MVM). Use the following formula:

$$R = (A \times 10^8) / (365 \times T \times V \times L)$$

where,
R = crash rate
A = number of reported crashes
T = time period of the analysis in years
V = AADT
L = Length of the segment in miles

Micron Technology Inc.
c/o Anna Eberlin, aeberlin@micron.com

RE: Improvements in support of Micron campus expansion

Dear Ms. Eberlin:

Idaho Transportation Department (ITD) previously reviewed and accepted the Traffic Impact Study (NV5, January 2023) associated with the Micron campus expansion. ITD has continued to meet with Micron representatives regarding the study and transportation improvements in support of the expansion project.

The following intersection would be impacted beyond the thresholds requiring mitigation, and as of the date of this letter, the project has obtained the necessary permits from ITD and completed this mitigation:

Study Intersection 3. Memory Road at Federal Way / 184 WB Ramp

- Re-configure the SB approach to the intersection to include a left turn lane
- Configure the east side of the intersection to include a shared thru-right lane in the WB direction and a single EB lane

Based on this information and given the low percentage of the project's trips through intersections at Gowen Road / Technology Way, Gowen Road / Federal Way, and Gowen Road / I-84 EB Ramp, no mitigation to these intersections is required for the project.

Additionally, ITD, Micron and other local agencies have identified multiple projects/improvements that Micron will help fund to improve roadway functionality, and enhance pedestrian/bicycle facilities on the highway system adjacent to the Micron campus:

Construction of a detached multi-use pathway, and related features along the northeast corner of State Highway 21 and Technology Way, for a distance of approximately 600 feet. This project includes the removal of the existing pathway, adjustments to the curb and gutter, and restoration of the surrounding landscape.

Improvements to the Eastbound I-84 ramp at Highway 21.

Improvements to the intersection and surrounding roadway segments of Highway 21 and Federal Way

Micron will help fund these projects through a contribution of \$140,000. ITD or third parties working with ITD will obtain necessary approvals, design, and construct these projects. ITD and Micron will continue to coordinate the details to facilitate funding of these projects. ITD appreciates Micron's support in improving the local highways facilities near the campus.

Sincerely,

Brian Duran
Development Services Planning Manager

EXTERNAL

This is consistent with the information reviewed by ACHD and I confirm the information below.

Thanks,
Christy

Subject: Re: [EXT] Micron Traffic Study - IMMEDIATE RESPONSE REQUESTED [GP-DMS.016642.0002.FID1041813]

Caution: This is an external email and has a suspicious subject or content. Please take care when clicking links or opening attachments. When in doubt, contact your IT Department

Thank you Christy! Here is the summary of mitigation for ACHD confirmation. Nothing has changed on ACHD roadways. An email response that you concur is sufficient. Appreciate your time on this busy day!
Deb

ACHD

No changes have occurred regarding the roadways within ACHD's jurisdiction. Consistent with prior communications and with ACHD policy, given the low percentage of project trips (less than 10%) through intersections identified in the traffic impact study, no mitigation at those intersections is required. The following intersection would be impacted beyond the thresholds requiring mitigation:

Federal Way at Gate B

- Install a Traffic Signal (pending a warrant analysis)
- Or eliminate left turn movement out of Micron campus

This mitigation is planned to be completed by Micron upon commencement of the project in 2025 to the extent required (and allowed) by ACHD based on traffic signal warrant analysis and use of Gate B. Micron is also responsible for paying impact fees.

Good morning - I am in meetings all day today, including a lunch meeting! If you can prepare a statement for me to concur with I can respond to that.

Thanks,
Christy

Subject: RE: [EXT] Micron Traffic Study - IMMEDIATE RESPONSE REQUESTED [GP-DMS.016642.0002.FID1041813]

Caution: This is an external email and has a suspicious subject or content. Please take care when clicking links or opening attachments. When in doubt, contact your IT Department

Hi Brian and Christy:

Following up on our prior communications in the email chain below, the NEPA team has requested confirmation from ITD and ACHD regarding current mitigation for the project, summarized below. If at all possible, **we need a response by noon on Thursday**. I'm very sorry for the short notice; we've been working with ITD on recent updates within their jurisdiction but we've learned we need ACHD's confirmation as well. An email response is sufficient. Please let me know of any concerns or questions. Thank you! Deb

ITD

Given the low percentage of the project's trips through intersections at Gowen Road / Technology Way, Gowen Road / Federal Way, and Gowen Road / I-84 EB Ramp, no mitigation to these intersections is required for the project. The following intersection would be impacted beyond the thresholds requiring mitigation, and the project has completed this mitigation:

Memory Road at Federal Way / 184 WB Ramp

- Re-configure the SB approach to the intersection to include a left turn lane
- Configure the east side of the intersection to include a shared thru-right lane in the WB direction and a single EB lane

Additionally, Micron and ITD have identified an ITD-priority project that Micron would fund prior to commencement of the project in 2025 to improve pedestrian and bicycle safety adjacent to the Micron campus: construction of a detached multi-use pathway along the north side of Gowen road near the intersection with Technology Way.

ACHD

No changes have occurred regarding the roadways within ACHD's jurisdiction. Consistent with prior communications and with ACHD policy, given the low percentage of project trips (less than 10%) through intersections identified in the traffic impact study, no mitigation at those intersections is required. The following intersection would be impacted beyond the thresholds requiring mitigation:

Federal Way at Gate B

- Install a Traffic Signal (pending a warrant analysis)
- Or eliminate left turn movement out of Micron campus

This mitigation is planned to be completed by Micron upon commencement of the project in 2025 to the extent required (and allowed) by ACHD based on traffic signal warrant analysis and use of Gate B. Micron is also responsible for paying impact fees.

EXTERNAL

Hi Deb – ACHD has no objection to these updates.

Thanks,

Christy

Hi Christy and Brian, our NEPA team has requested written confirmation that ACHD and ITD have no objection to the final TIS updates. As summarized before, the recommended mitigation did not change. An email response is sufficient.

Please let us know if you have any questions or concerns we can address.

Thank you,
Deb

Hi Christy and Brian,

Please see the attached update from NV5 to the traffic analysis for the Micron expansion project. The purpose of the update is to include the wastewater treatment facility. This facility was outside the scope of the original applications to the City and associated traffic impact study because the facility is intended to be permitted, constructed and operated by others. But the NEPA process requires Micron to include this as a related project so we have included the impacts from this facility in the scope. As you probably recall, that is the same reason we recently updated the study through year 2030.

Per John's attached memorandum, adding in the trips for the wastewater facility did not change the prior conclusions or mitigations.

Brian, the memo was addressed to Wendy, but we understand from her recent communications that we should direct this to you.

Please let us know of any questions or concerns.

Thank you,
Deb
