Predictive Analytics Approach with Time Series Data
using Machine Learning

Sanket Amberkar
SVP, Falconry

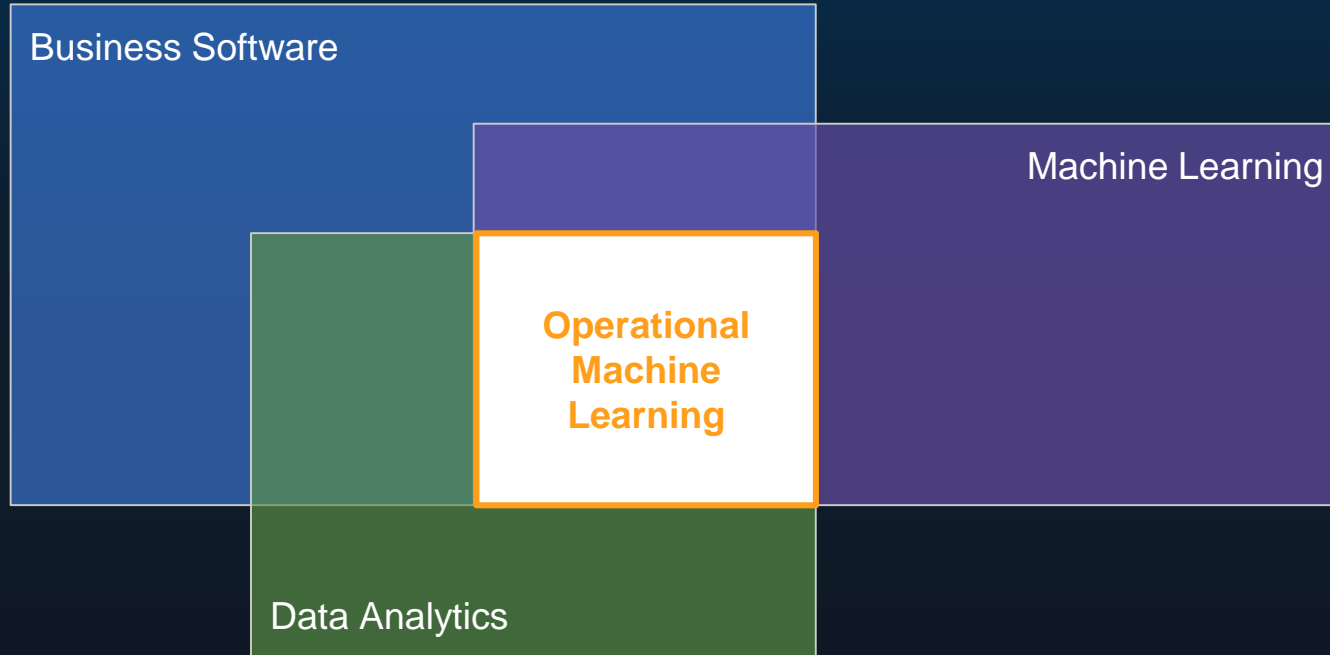

20% Productivity Rise* From Digital Analytics

Improvements seen across key business vectors

Operational Machine Learning

New market category to address massive data wave

Time Series: The Dark Data Within Operations

Ubiquitous, but underutilized, insight-rich data in industrial operations

Time

Machine Learning

Dark, proprietary data

- Already generated in machinery
- No long term benefit
- Proprietary and restricted access

Operation throughput, quality, safety

- Discover unanticipated behaviors
- Find early warning signs
- Create reliable alarms

Patterns Provide Insight But Need To Be Discovered

Multiple challenges for conventional machine learning / deep learning approaches

Patterns are very complex

- Temporal patterns appear over windows of time - NOT in single snapshot

Behavior of interest are not adequately labeled

- Very few occurrences to learn from
- Need to support BOTH unsupervised and semi-supervised learning

Limitations of traditional approaches

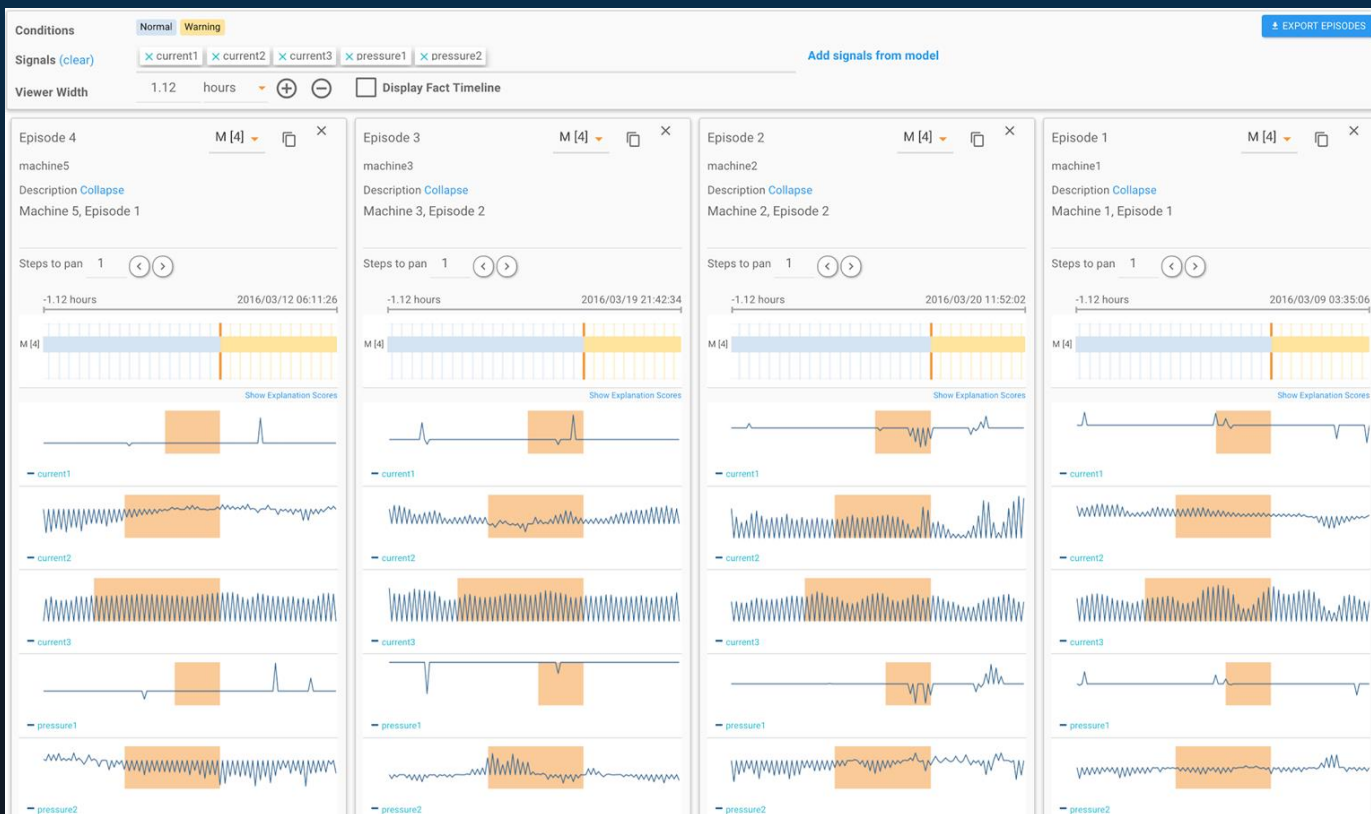

- Traditional approaches require data scientists and do not scale or adapt to conditions

Real-time data is not perfect

- Standard analytics middleware do not handle synchronization or gaps in data

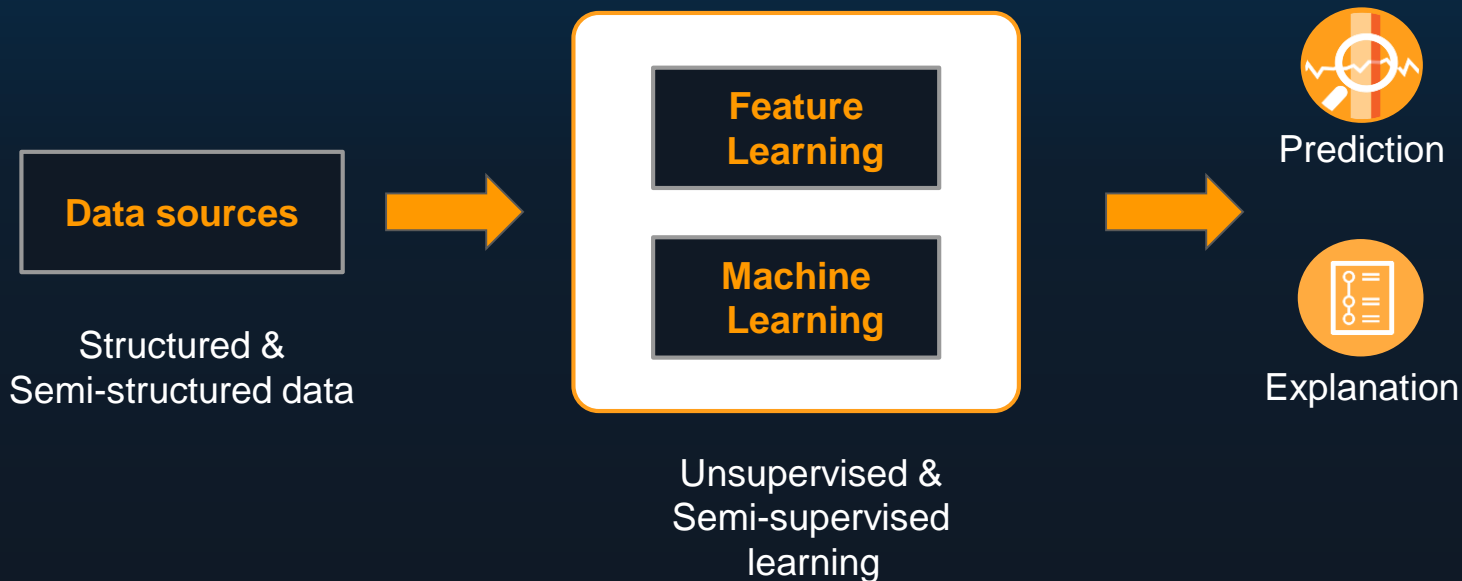

Visualizing Key Patterns in Important Signals

Patterns are not all the same to human observer

Emerging Understanding of “Data Scientist In a Box”

Essential for the industrial subject matter experts to self-service machine learning

Unsupervised Learning of Patterns

Learning on partial data

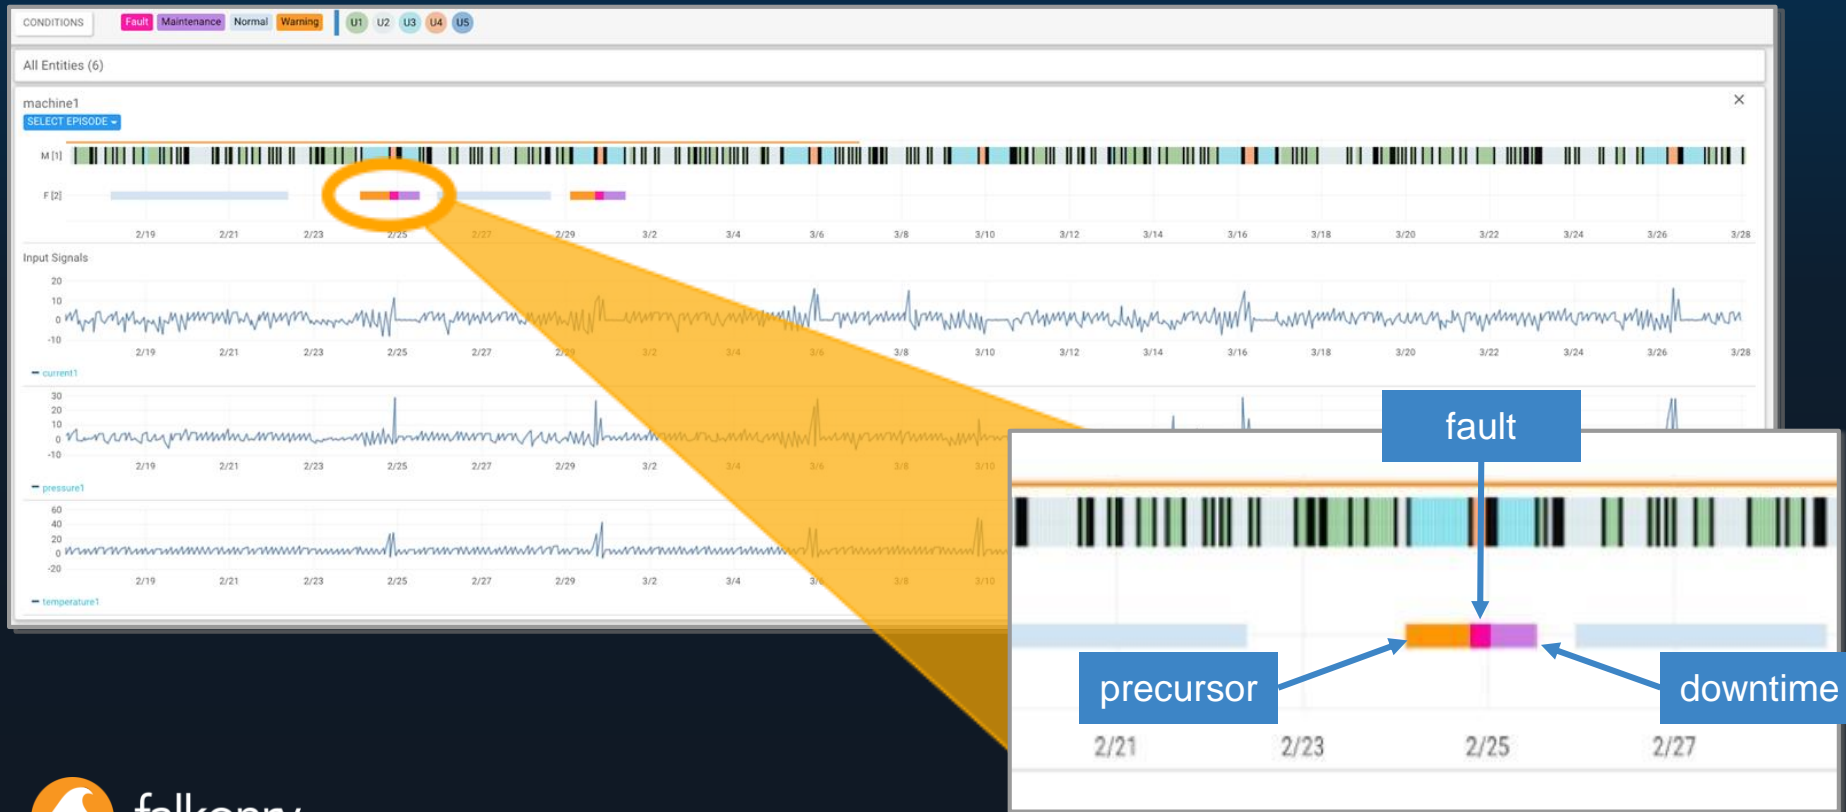

Learning Range

Falconry LRS picks out different patterns including the fault and its precursor.

Semi-Supervised Learning of Patterns

Adding “facts” to learn patterns

Issues Mapping Initial Model to Other Machines

Some confusion on categorizing Machine # 2

Easily Addressed With A Few Additional Facts

Adding data from Machine #2 improves the prediction for all remaining machines

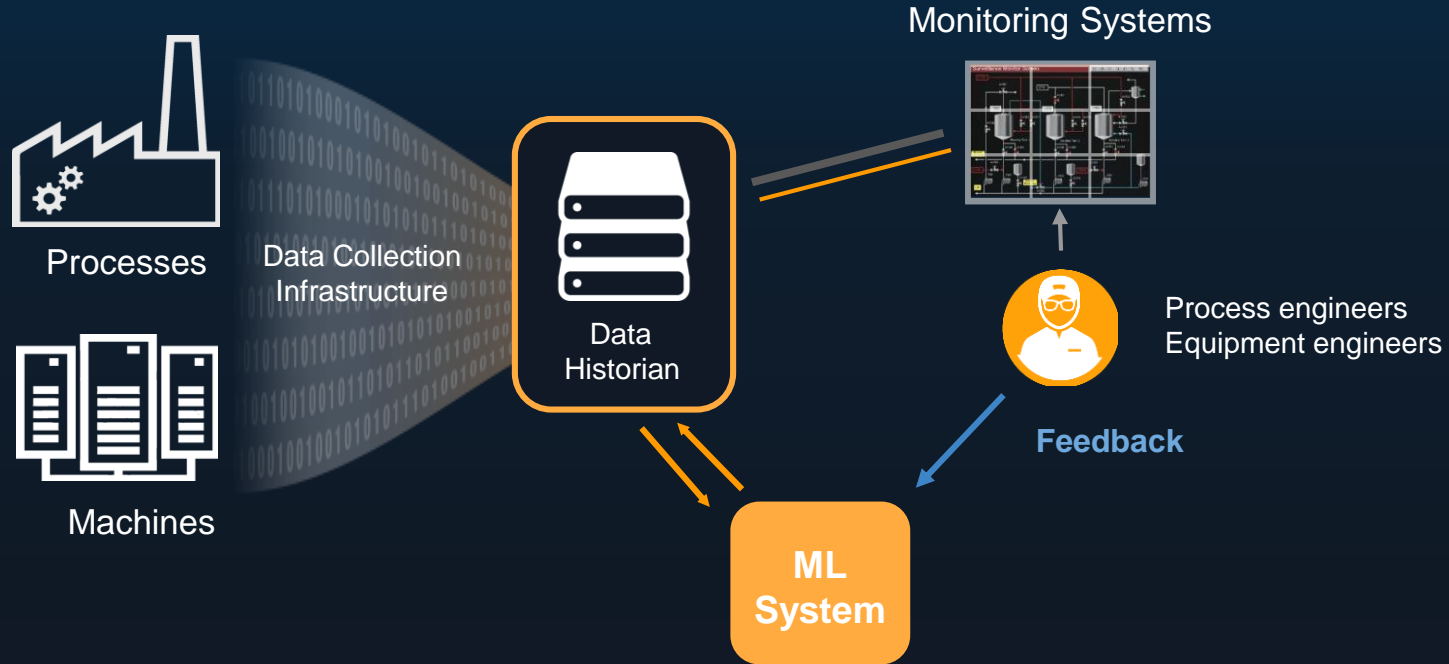

Episode Comparison to Study Patterns

Distinct transition from normal operation to warning condition

Condition Monitoring with Predictive Analytics

Smart manufacturing and Smart factory

Use Cases Across Industries

Production optimization: throughput, quality, safety, and yield improvements

Oil & Gas Operations

- Detect pre-shutdown patterns
- Real-time alerts for uncontrolled emissions

Mining & Metals Production

- Discover equipment downtime patterns
- Real-time production throughput adjustment

Power & Energy Operations

- Fault classification of power electronics
- Distributed asset monitoring

Automotive Manufacturing

- Detect deviations in discrete manufacturing
- Real-time quality estimation of welding

Semiconductor Manufacturing

- Predictive maintenance of equipment
- Optimize machine utilization

Chemical Manufacturing

- Quality estimation of batch process
- Monitor machine health

Falkonry LRS

A strategic approach to digital operations transformation

- ✓ No data scientists required
- ✓ High value information from time series data
- ✓ Discover invisible patterns in minutes
- ✓ Ready-to-use machine learning is a strategic tool
