High-priority recommendation:

Universal Zero Trust is now possible

The federal government should support and prioritize the creation of a

Universal Name System

Opportunity:

Universal Zero Trust

"Never trust, always verify" globally and automatically

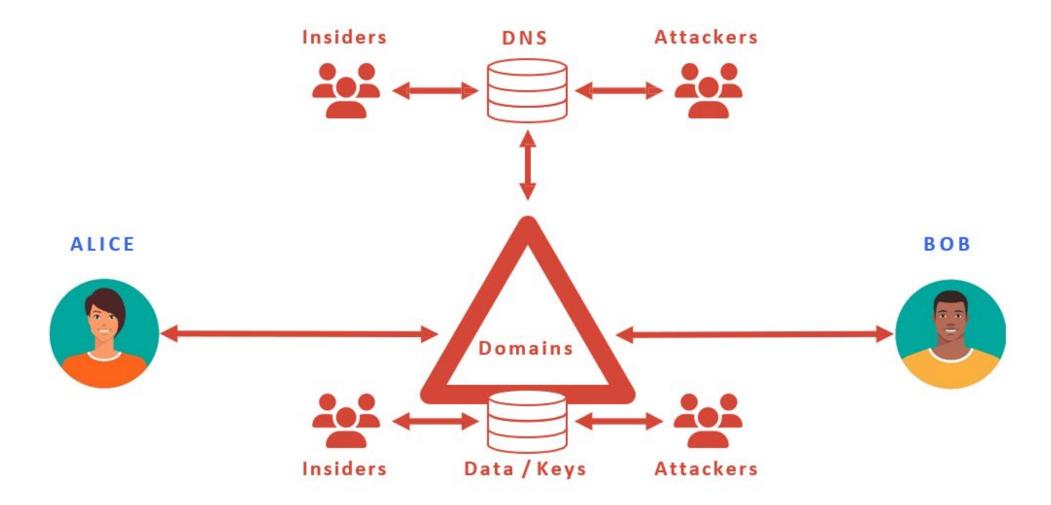

Automated pairwise cryptographic security

between any two persons and/or non-person entities, with no human in the middle

Universal Challenge

The web's domain-centric architecture puts privileged insiders in the middle which precludes zero trust

Universal Challenge:

Enabling Technology

Confidential Computing

Protect data in use even from system administrator

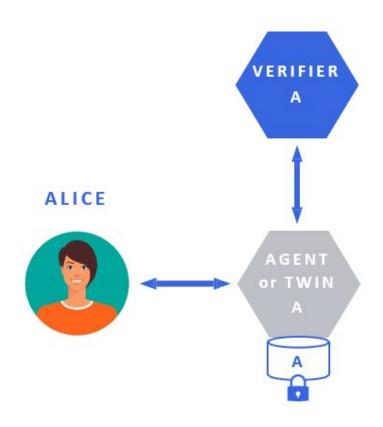

Enable attestation of hardware and software integrity

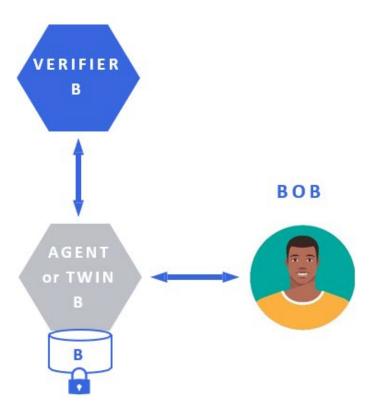

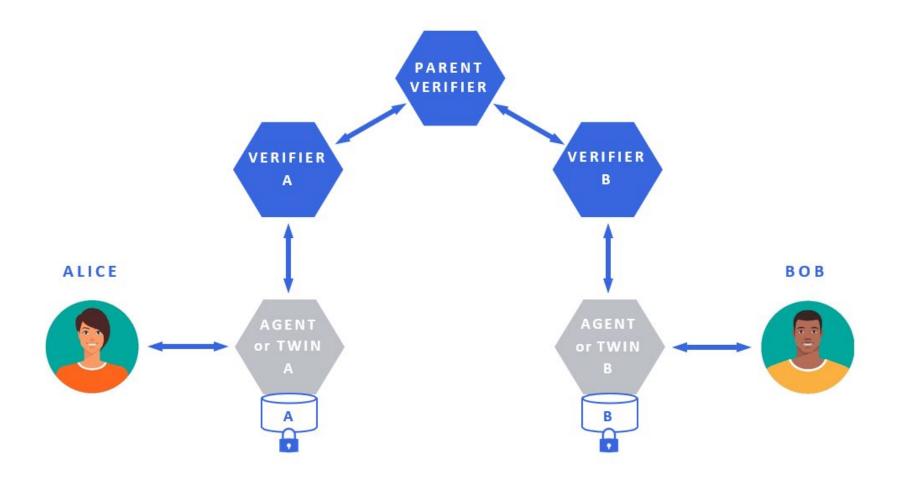

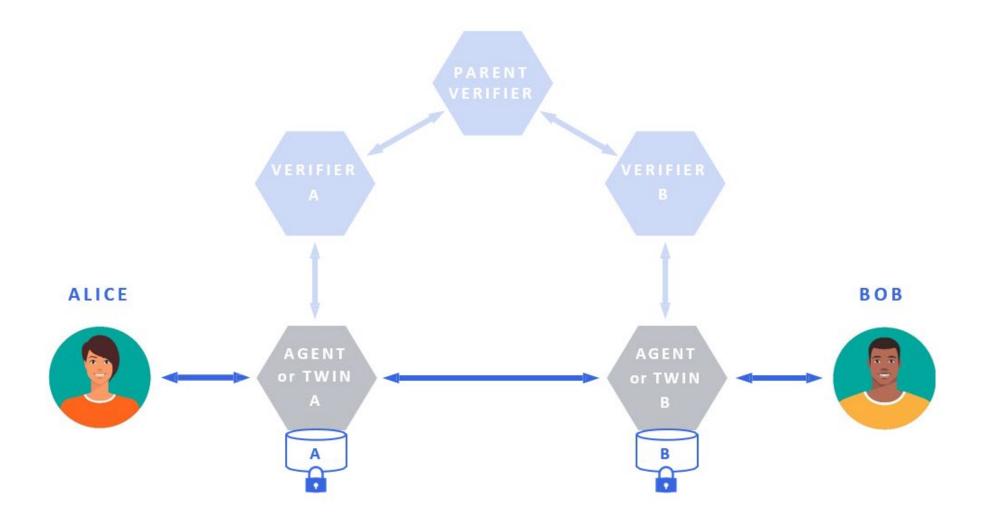

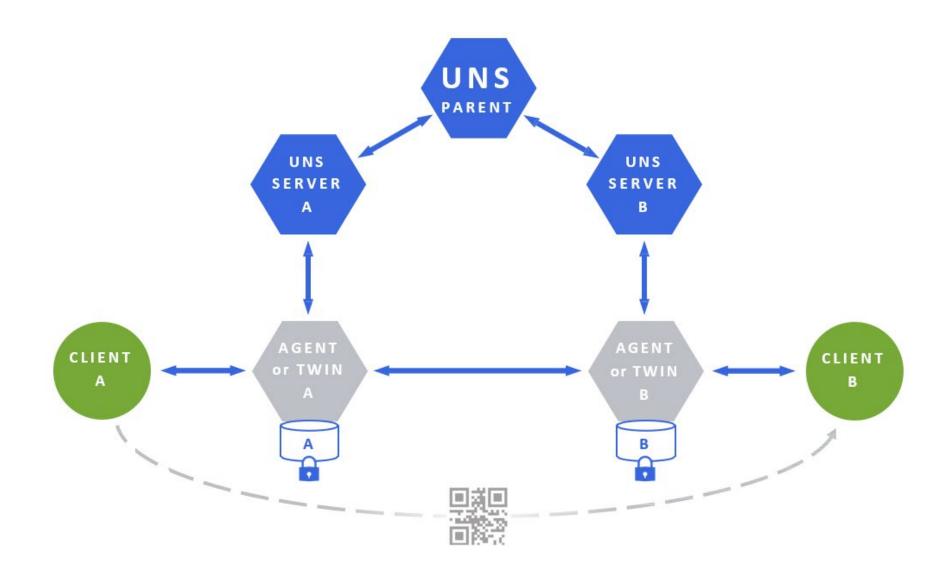

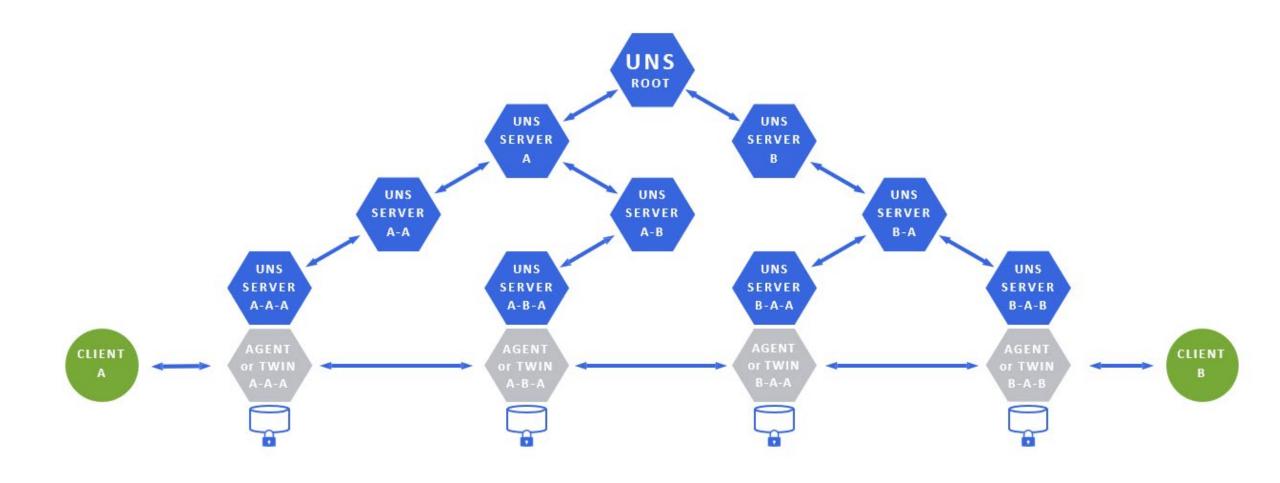

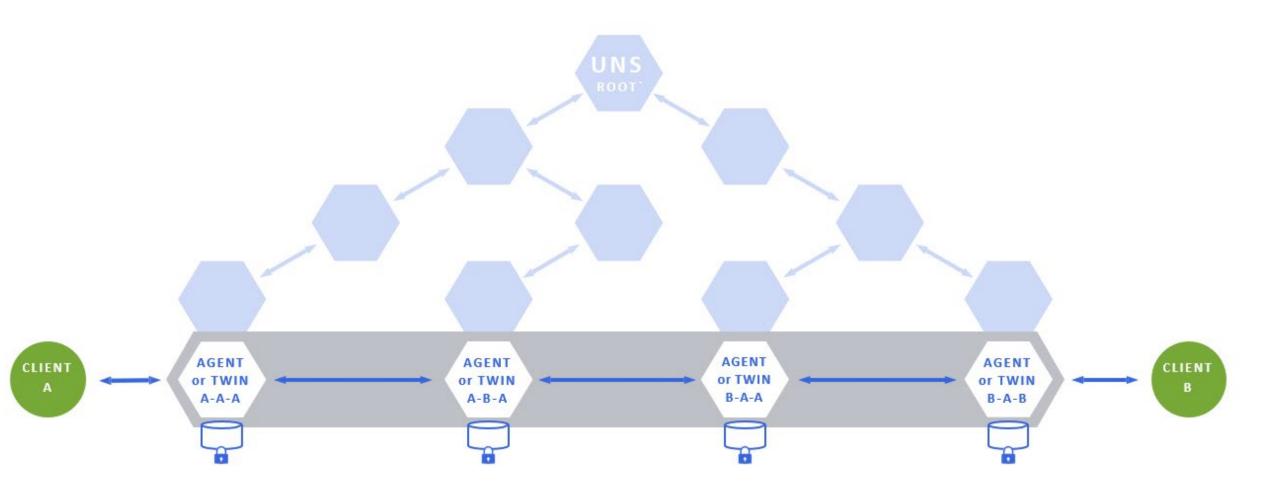

Presentation to the NIST IoT Advisory Board - August 22, 2023 - Manu Fontaine - manu@hushmesh.com

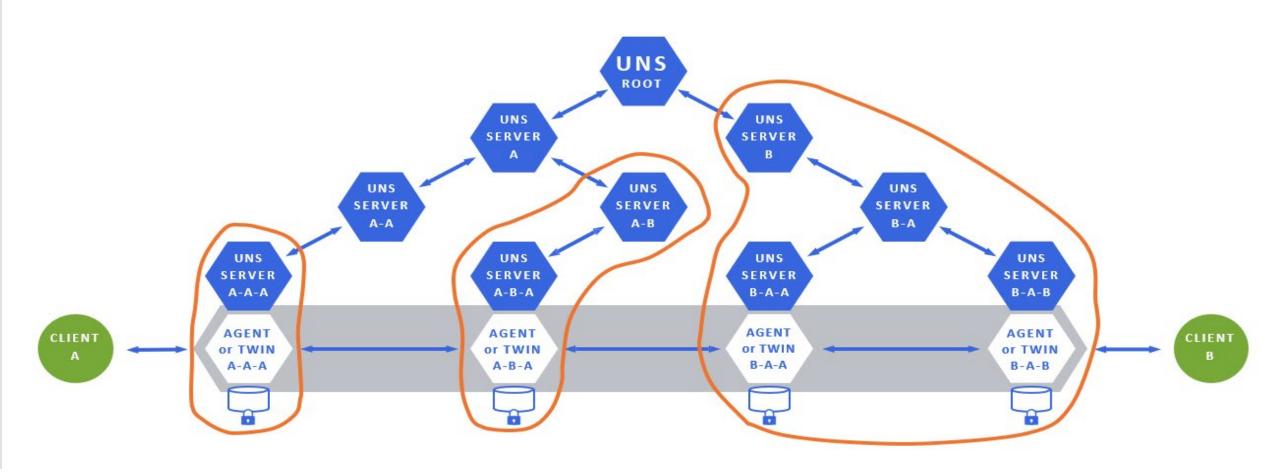

Universal Name System

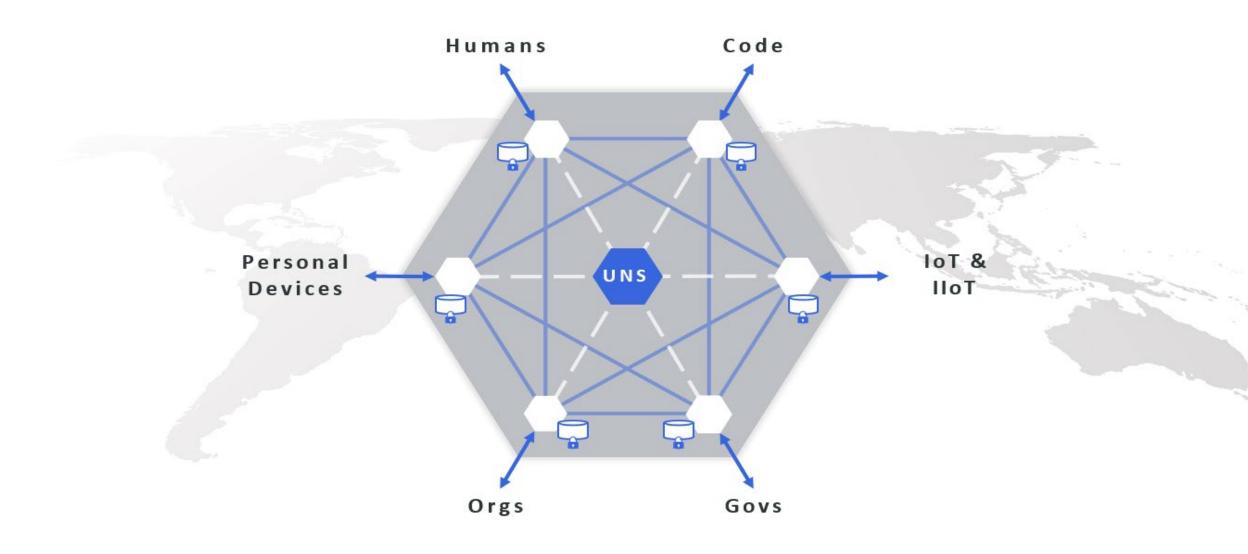

Universal Zero Trust

Globally Decentralized

Presentation to the NIST IoT Advisory Board - August 22, 2023 - Manu Fontaine - manu@hushmesh.com

Thank you
