SURF Colloquium, Reactor Operations NCNR

August 3, 2023

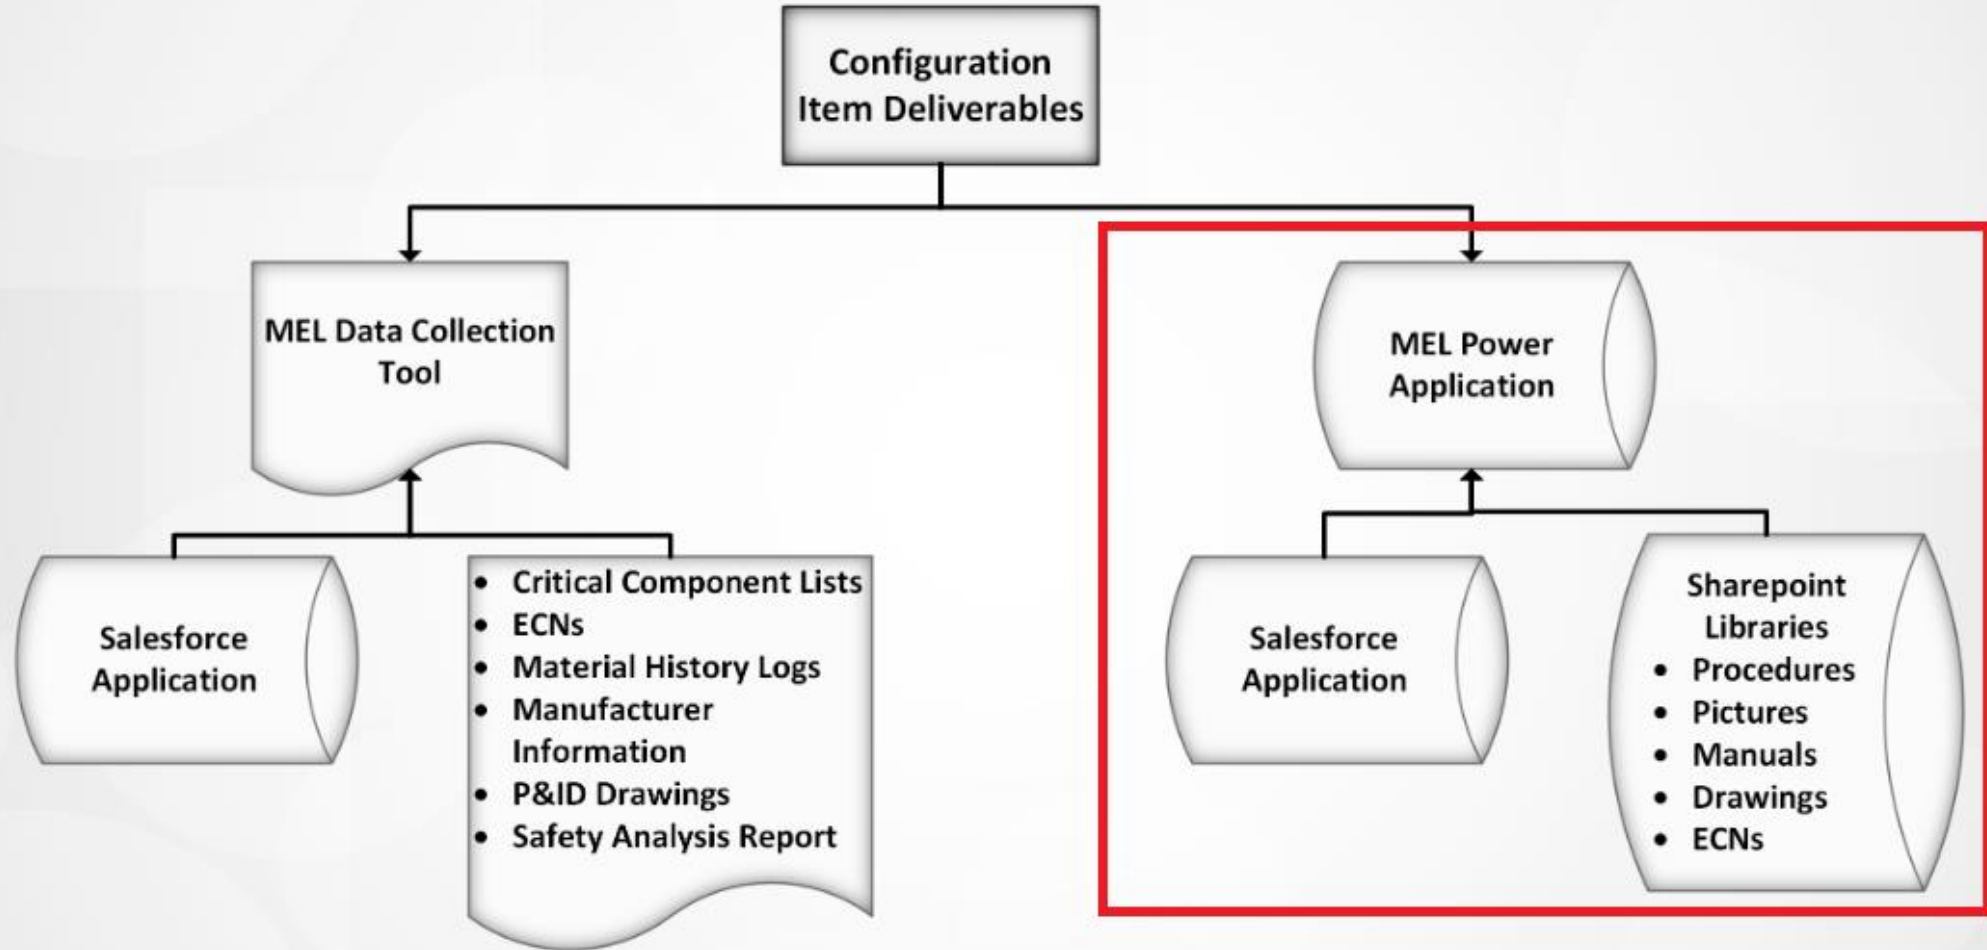

UNIVERSITY of
SOUTH FLORIDA

Project Terms

-
- **NCNR** - NIST Center for Neutron Research (NCNR) is a division of NIST specializing in neutron measurement, research, standards, and capabilities for the U.S. research community. As such, the NCNR is under the federal jurisdiction of the Nuclear Regulatory Commission and the U.S. Department of Energy.
 - **NBSR** - National Bureau of Standards Reactor (NBSR) is a 20 MW nuclear reactor using enriched UO₂ fuel with D₂O coolant; The NBSR is used for various applications but is primarily specialized for its use for neutron science research at the NCNR.
 - **MEL** - The Master Equipment List (MEL) is a digitalized comprehensive inventory and equipment list showcasing all components, such as valves, regulators, switches, gauges, filters, compressors, pumps, dampeners, etc., at the NCNR.
 - **CI** - Configuration Items (CIs) are any component within hardware, software, information data, or documentation within the IT environment that must be managed for the development process. A configuration management system (CMS) can be employed to track CIs.
 - **EAMS** – A software that helps organizations or corporations manage and track their ongoing maintenance, repair, and refurbishment activities. For the NCNR, the EAMS will be implemented from the data and feedback based on the MEL to work towards a streamlined maintenance and logistics management system

Master Equipment List Application Project

Project Introduction

Create a centralized cohesive equipment database system with real time data integration services

MEL Power Application deals with transfer of information and data from MEL Data Application

Think of MEL Software Data Collection tool is front end, and MEL Power Application is back-end of NBSR MEL

The completion will greatly support correlation checking at NCNR for maintenance of the NBSR and Reactor Operations for ease of access

MEL is a sub-project of supporting a larger digital transformation strategy at the NCNR

Software Application Implementations

Establish the baseline requirements for the applications, along with the retrieval of equipment reference information, equipment communication, information status, update methods, and user interface

Establish the data architecture, such as its principles, assets, models, and framework

Establish data sources – such as its information regarding component information, engineering drawings, vendor records, purchase orders, and specifications

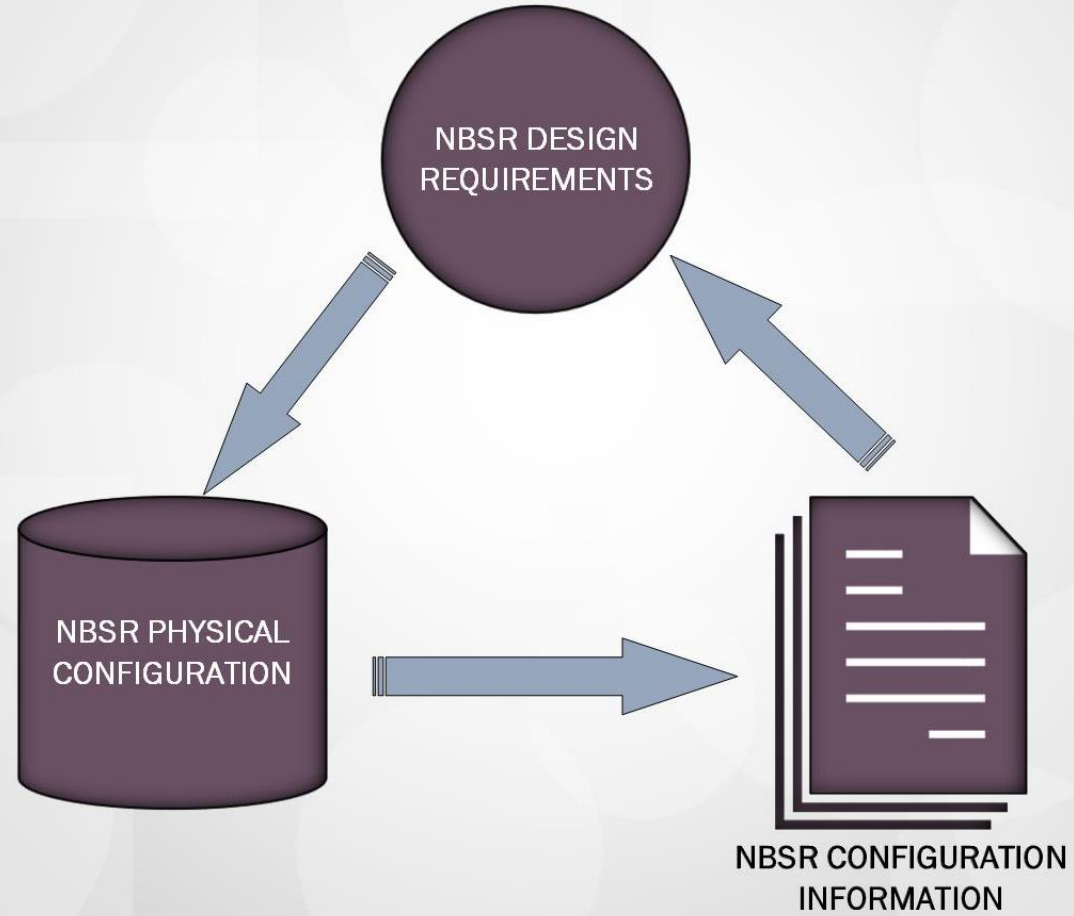

Build the application and test the application up to an acceptable format for the application to where a software plan can be drafted based on the applications format

Establish the Software Configuration Management (SCM) controls to maintain the integrity of the software application

National Bureau of Standard Reactor (NBSR) Configuration Management Model

MEL Enterprise Data Architecture Outline

	ENTERPRISE DATA MODEL	INFORMATION VALUE CHAIN	DATA DELIVERY ARCHITECTURE	
CONCEPTUAL LEVEL	Licensing / Design Bases Physical Config Maint Processes Ops Processes	Legacy data source processing KPIs* Documentation update KPIs*	Conceptual Data Delivery Diagram MEL Tool User Aid	<u>Design Stage</u> R: Data / App Architect A: NBSR QA C: NBSR Stakeholders I: NCNR IT, OISM
	LOGICAL LEVEL	Data attributes Data mapping Data relationships Data normalization Model validation	Data KPIs* Analysis Trends Data modeling improvements	
PHYSICAL LEVEL		Operating Platform APP Selection Data Architecture Programming	App performance KPIs* User feedback improvements	Data Migration Diagram Software CM Plan

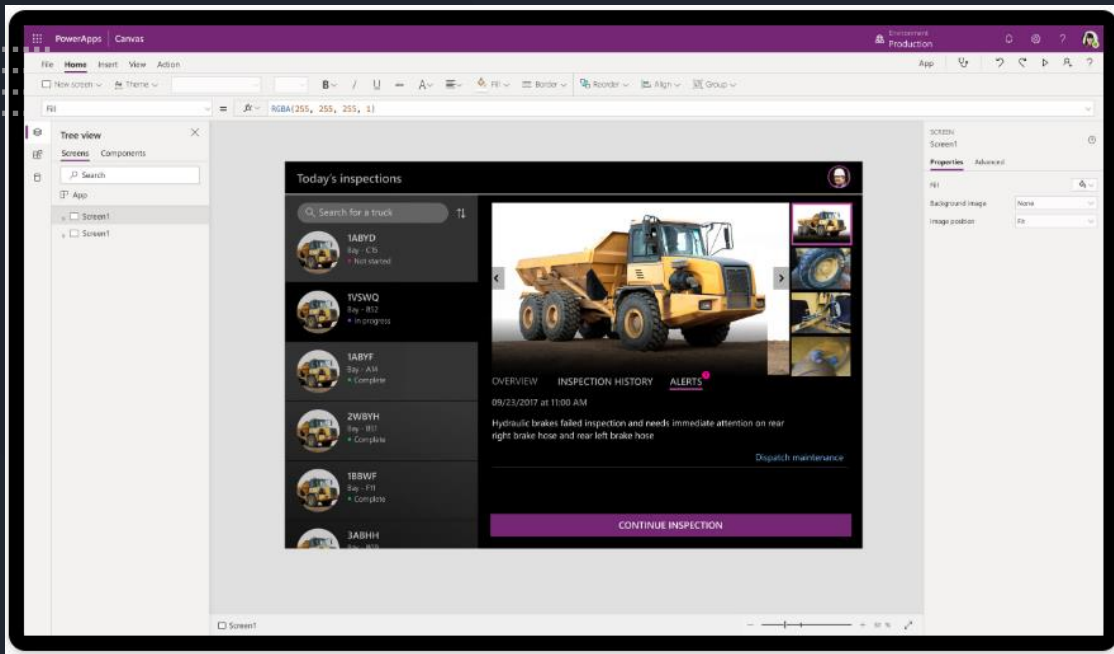

KPI: Key Performance Indicator

NCNR Reactor Operations and Engineering Digital Transformation

Application Programs

- Power Automate is used as a tool for loading tables and automating their process onto the Power Application.
- Power BI is used as a support tool to Power Applications in analyzing data patterns and refining data information.
- Power Applications is a tool within the Microsoft Suite that enables developers to build software applications with little-to-no programming languages or extensive programming knowledge.
- SharePoint is used as a digital cloud storage service, where Power Automate loads the lists and libraries, and the information is compiled into a single view in the Power Application.

Power BI

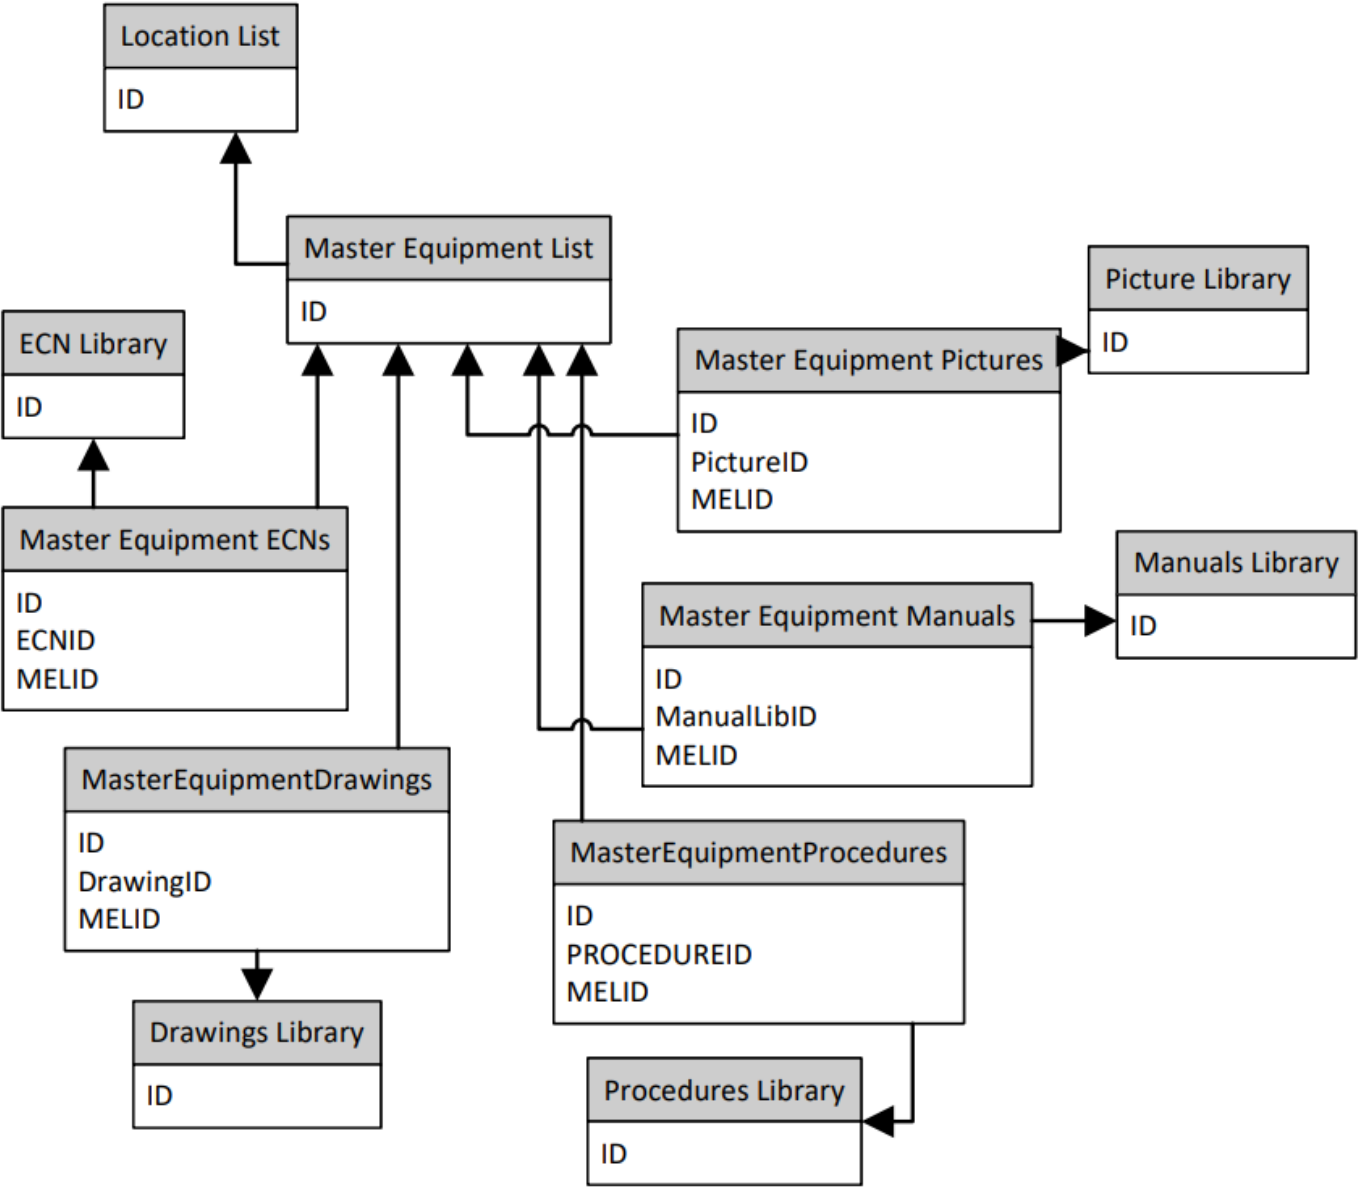

Power Apps

Power Automate

Master Equipment Solution Table

NBSR Equipment Application

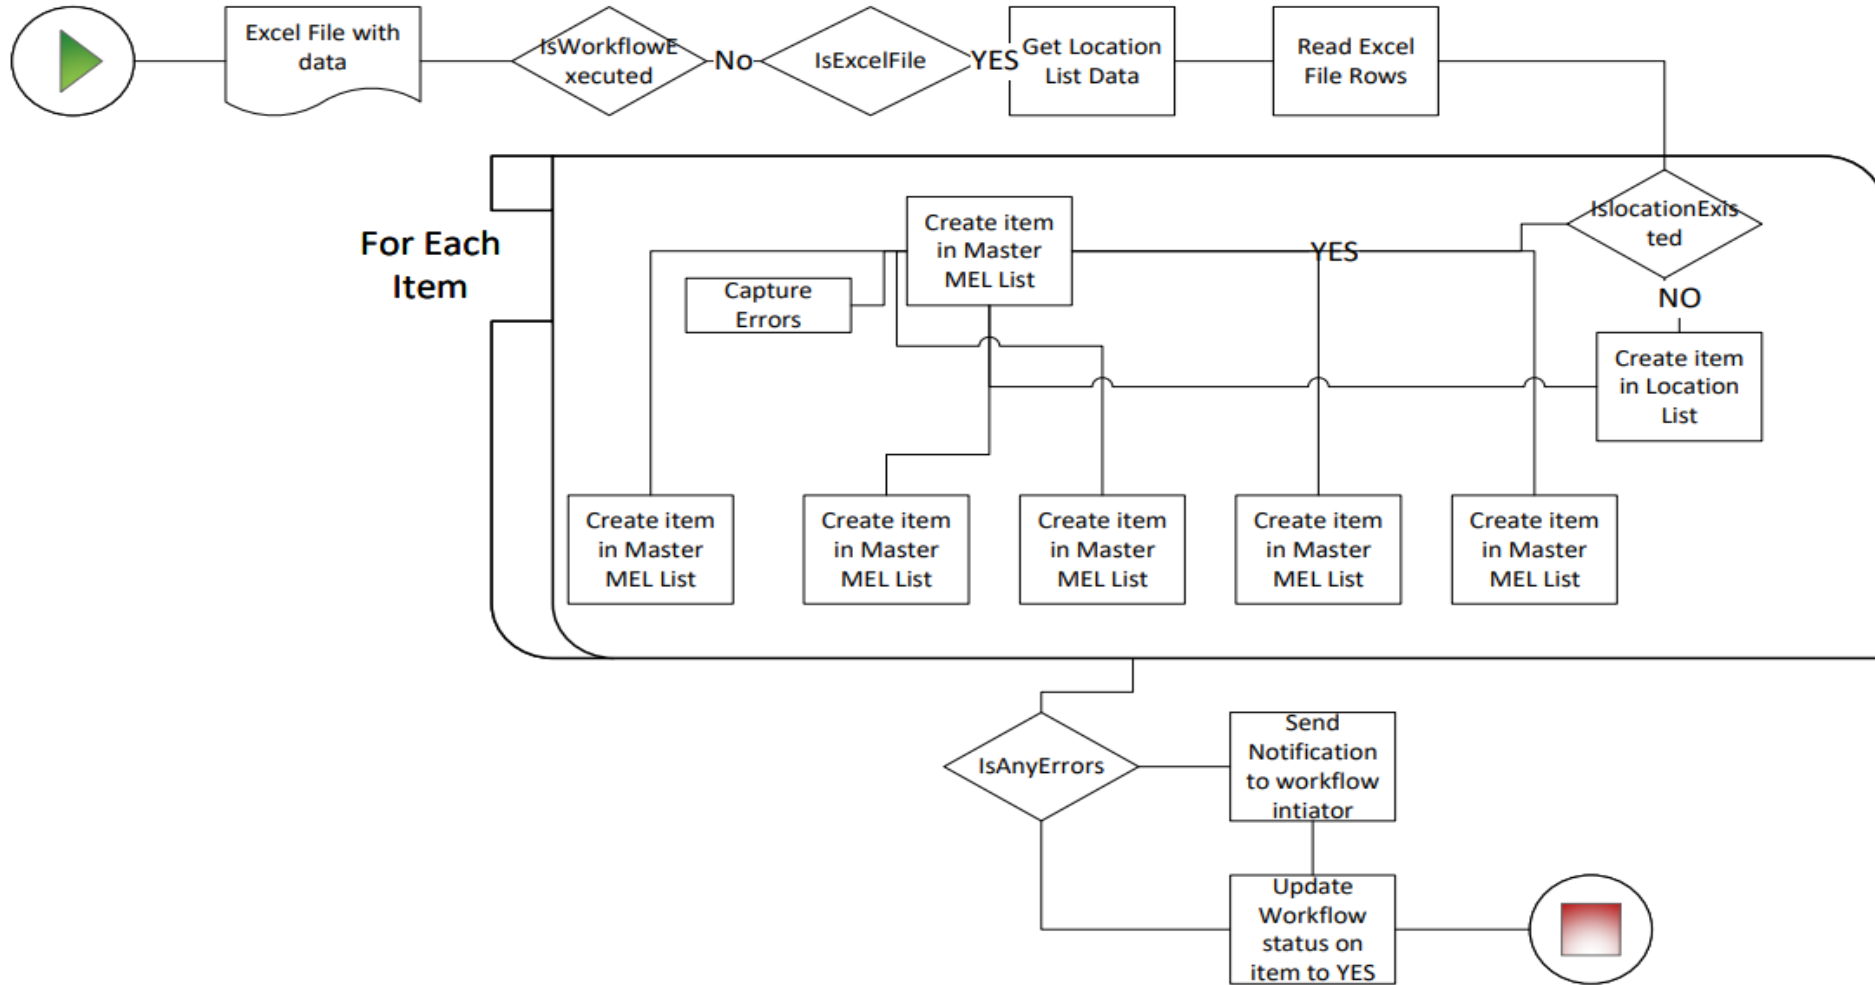

- With Power Applications, new component information can be added in, modified, edited or deleted based on the requirements with dropdown menus.
- The Power Application is still under development, and additional reference information is being implemented. As the application expands in scope further, software developers will also improve the User Interface for better accessibility.
- Researchers can quickly access the component reference materials, which are in the tabs - such as - reference engineering drawings, ECN information, and manuals.

The screenshot displays the 'Master Equipment Solution App' interface. The top header is blue with the text 'Master Equipment Solution App'. Below the header, there is a search bar for 'Search Component ID' and a 'Selected Equipment Snapshot: HEV-104' section. The main content area is a table with columns: Component ID, Component Type, Critical Component, and Location. The table lists various attributes for HEV-104, such as Safety Function, Catalog Number, Voltage, Technical Specification, and Installation Date. Below the table, there are tabs for 'Pictures', 'ECNs', 'Drawings', and 'Manuals'. The 'Pictures' tab is active, showing a list of equipment pictures with columns for the image name and file path. The first image is 'HEV-104_1.JPG' with the path 'Pictures/HEV-104_1.JPG'. The second image is 'HEV-104_2 Tag.jpg' with the path 'Pictures/HEV-104_2Tag.jpg'. Each image entry has edit and delete icons.

Component ID	Component Type	Critical Component	Location
HEV-104	Gate Valve	No	South Yard
Safety Function	System	SubSystem	Manufacturer
	Helium Sweep & Supply	Helium Supply	Whitey
Catalog Number	Model	Serial Number	Power Source
	SS-1KS6	NA	
Voltage	Amperage	Control style	Status
			Active
Technical Specification	Maintenance Owner G...	Size	Normal Operating Con...
	ROE	0.375"	Open
Installation Date	Diaphragm RD	Refurbish Date	

Equipment Pictures

MEL Information Transfer

Future Goals of NBSR Equipment Application

Baseline Physical Configuration Component Data

Transform Physical Configuration Component Data into a Digital Modeling Tool (MEL APP)

Baseline remaining supporting legacy data and develop Modeling Tools for Legacy Data

Transform remaining supporting legacy data into Digital Modeling Tools

Transition Digital Modeling Tools into an Enterprise Asset Management System

Internship CORE Reflection

Goals

Gain Information Technology (IT) experience at the National Institute for Standards and Technology (NIST)

Skills & Knowledge

Gained valuable experience in data management, data analysis, and understanding of tools and their usage, such as Excel, Power BI, and Power Applications, both from a technical and non-technical perspective.

Experience

- Worked on a team to develop and lay the foundations to develop a Master Equipment List to work our way towards a CMMS
- Currently extending the internship, and working on a software configuration management plan as the baseline for standards and changes for the NBSR EAMS project

Applications

IT applications can be applied in almost every domain or field - since corporations and organizations have issues with their data management for logistics, critical infrastructure, customer service, or customer management

Acknowledgments

Acknowledgements to NIST and the SURF (CORE) Internship program

Acknowledgements to CHRNS

Acknowledgements to NCNR Reactor Operations

- Dr. Julie Borchers – SURF Program Manager
- Michelle Dudely – Project Manager
- Lance Kingsbury – Reactor Operator
- Jimyung Ryu – International Associate
- Nageshwar Bhongiri – Senior Software Developer
- Christopher Lipscomb – Fellow CORE Intern

The Center for High Resolution Neutron Scattering (CHRNS) is a national user facility jointly funded by the NIST Center for Neutron Research (NCNR) and the National Science Foundation (NSF) under Agreement No. DMR-2010792
