

# **OSAC 2022-S-0012 Standard for Proficiency Testing in Friction Ridge Examination**

*Friction Ridge Subcommittee  
Physics/Pattern Scientific Area Committee  
Organization of Scientific Area Committees (OSAC) for Forensic Science*

## **Draft OSAC Proposed Standard**

# **OSAC 2022-S-0012 Standard for Proficiency Testing in Friction Ridge Examination**

Prepared by  
Friction Ridge Subcommittee  
Version: 1.0  
August 2021

---

### **Disclaimer:**

This OSAC Proposed Standard was written by the (subcommittee) of the Organization of Scientific Area Committees (OSAC) for Forensic Science following a process that includes an [open comment period](#). This Proposed Standard will be submitted to a standards developing organization and is subject to change.

There may be references in an OSAC Proposed Standard to other publications under development by OSAC. The information in the Proposed Standard, and underlying concepts and methodologies, may be used by the forensic-science community before the completion of such companion publications.

Any identification of commercial equipment, instruments, or materials in the Proposed Standard is not a recommendation or endorsement by the U.S. Government and does not imply that the equipment, instruments, or materials are necessarily the best available for the purpose.

To be placed on the OSAC Registry, certain types of standards first must be reviewed by a Scientific and Technical Review Panel (STRP). The STRP process is vital to OSAC's mission of generating and recognizing scientifically sound standards for producing and interpreting forensic science results. The STRP shall provide critical and knowledgeable reviews of draft standards or of proposed revisions of standards previously published by standards developing organizations (SDOs) to ensure that the published methods that practitioners employ are scientifically valid, and the resulting claims are trustworthy.

The STRP panel will consist of an independent and diverse panel, including subject matter experts, human factors scientists, quality assurance personnel, and legal experts, which will be tasked with evaluating the proposed standard based on a comprehensive list of science-based criteria.

For more information about this important process, please visit our website at: <https://www.nist.gov/topics/organization-scientific-area-committees-forensic-science/scientific-technical-review-panels>.

**DRAFT**

1 **1. Introduction**

- 2 1.1. This document has been developed with the objective of improving the quality and  
3 consistency of friction ridge examination practices.  
4
- 5 1.2. The purpose of this document is to provide a standard for assessing the performance of  
6 individual FSP personnel and the overall FSP quality system through proficiency testing  
7 in friction ridge examination. This document is intended to be supplemental to the  
8 International Organization for Standardization / International Electrotechnical  
9 Commission (ISO/IEC) 17043 *Conformity Assessment – General Requirements for*  
10 *Proficiency Testing* standards with discipline specific information for friction ridge  
11 examination.  
12
- 13 1.3. Proficiency testing is an integral component of a Forensic Service Provider’s (FSP’s)  
14 quality assurance program. Proficiency testing provides a means of:  
15
- 16 1.3.1. evaluating the skills and abilities of individual FSP personnel to perform specific  
17 tests or measurements.  
18
- 19 1.3.2. evaluating the effectiveness of a FSP’s quality system (e.g. facility, equipment,  
20 procedures, training, and quality controls).  
21
- 22 1.3.3. identification of vulnerabilities or problems in the quality system necessitating  
23 corrective action.  
24
- 25 1.3.4. identification of interlaboratory differences.  
26
- 27 1.4. Tests can vary in design, quality, and difficulty. The reliability of results produced by a  
28 FSP depend on:  
29
- 30 1.4.1. The performance of the FSP when tested, and  
31
- 32 1.4.2. The robustness of the test taken by the FSP upon which performance was  
33 assessed.  
34
- 35 1.5. The robustness of the test taken by the FSP depends on factors related to the  
36 development, validation, and administration of the test as well as the evaluation of the  
37 results.  
38
- 39 1.6. Conformance to this standard ensures that tests are selected by the FSP for which the  
40 necessary documentation is available to enable a third party to evaluate the robustness of  
41 the test used for assessing the performance of the FSP. Conformance to this standard  
42 alone, without consideration of the robustness of the test upon which performance was  
43 assessed, does not imply the performance of the FSP is reliable or satisfactory.  
44

45 1.7. In this document, the following verbal forms are used: “*shall*” indicates a requirement,  
46 “*should*” indicates a recommendation; “*may*” indicates permission; and “*can*” indicates a  
47 possibility or capability.  
48

## 49 2. Scope

50 2.1. This document prescribes the minimum requirements for the selection, development,  
51 validation, administration, evaluation, and documentation of proficiency tests used by  
52 Forensic Service Providers (FSPs) for purposes of assessing the performance of the FSP  
53 personnel and overall FSP quality system related to friction ridge examination. These  
54 requirements are applicable to tests generated internally by FSPs and tests obtained from  
55 external sources.  
56

57 2.2. This document does not address requirements related to:

58 2.2.1. the specific method(s) for conducting friction ridge examinations.  
59

60 2.2.2. validation of novel or existing methods prior to implementation.  
61  
62

## 63 3. Terms and Definitions

64 For the purposes of this document, the following terms and definitions apply.  
65

66 3.1. Acceptable Result: A result that conforms to the assigned value or is otherwise  
67 permissible under casework conditions by FSP policy.  
68

69 3.2. Assigned Value: Value attributed to a particular property of a test specimen. NOTE:  
70 The assigned value provides the basis for which participant results are expected to  
71 conform and performance is evaluated.  
72

73 3.3. Complexity (of a Comparison): A characteristic of a comparison in which the attributes  
74 of one or both impressions may require additional consideration and quality control  
75 measures as it relates to the evaluation of a source conclusion. Comparisons can be  
76 designated as high complexity, low complexity, or non-complex.  
77

78 3.4. Complexity (of an Impression): A characteristic of an impression whose attributes may  
79 require additional consideration and quality control measures. Impressions can be  
80 designated as high complexity, low complexity, or non-complex.  
81

82 3.5. Consultation: A significant interaction, prior to the initiation of verification or technical  
83 review process, between FSP personnel regarding one or more impressions in question.  
84 NOTE: An interaction is considered “significant” when it involves a partial or complete  
85 examination of the impression(s) in question.  
86

87 3.6. Corrective Action: An action to eliminate the cause of a non-conformity and to prevent  
88 recurrence.

- 89  
90 3.7. Examination: The act or process of observing, searching, detecting, recording,  
91 prioritizing, collecting, analyzing, measuring, comparing, and/or interpreting.  
92  
93 3.8. Forensic Service Provider (FSP): A forensic science entity or forensic science  
94 practitioner providing forensic science services.  
95  
96 3.9. Friction Ridge Detail/Features: The combination of ridge flow, ridge characteristics,  
97 and ridge structure of friction ridge skin, as observed and reproduced in an impression.  
98 A large subset of the observed data used to compare and interpret similarity or  
99 dissimilarity between two impressions.  
100  
101 3.10. Ground Truth: The actual or true state of affairs concerning the source or type of items  
102 submitted for evaluation.  
103  
104 3.11. Interlaboratory Comparison: Organization, performance and evaluation of  
105 measurements or tests on the same or similar items by two or more FSPs in accordance  
106 with predetermined conditions.  
107  
108 3.12. Intralaboratory Comparison: Organization, performance and evaluation of  
109 measurements or tests on the same or similar items within the same FSP in accordance  
110 with predetermined conditions.  
111  
112 3.13. Observed Data: Any demonstrable information observed within an impression that an  
113 examiner relies upon to reach a decision, conclusion or opinion. This has historically  
114 been expressed as “features” or “minutiae,” but the use of the broader term “observed  
115 data” is inclusive of other types of data that may be considered beyond minutiae, such  
116 as quality, scars, creases, edge shapes, pore structure, and other friction ridge features.  
117  
118 3.14. Participant: Laboratory, organization or individual that receives proficiency test items  
119 and submits results for review by the proficiency test provider.  
120  
121 3.15. Proficiency Testing: Evaluation of participant performance against pre-established  
122 criteria by means of interlaboratory comparisons.  
123  
124 3.16. Technical Review: A qualified second party’s evaluation of reports, notes, data, and  
125 other documentation to ensure there is appropriate and sufficient support for the  
126 actions, results, conclusions, opinions and interpretations.  
127  
128 3.17. Test sample: A subset of items included as part of a test which are subject to  
129 examination by FSP personnel.  
130  
131 3.18. Test Specimen: A single item of the test sample.  
132  
133 3.19. Verification: Confirmation, through either re-examination or review of documented  
134 data by another examiner, that a conclusion or opinion conforms to specified

135 requirements and is reproducible. NOTE: “Specified requirements” are the FSP’s  
136 policies and procedures relating to Analysis, Comparison and Evaluation of friction  
137 ridge impressions.  
138

139  
140

## 141 4. General Requirements

142  
143  
144

### 4.1. Selection

145 4.1.1. Tests shall be selected which have been developed and validated in accordance  
146 with the requirements set forth in this standard (sections 4.2 and 4.3).  
147

148 4.1.2. Where available and appropriate for the job function(s) being tested, tests shall be  
149 obtained by an external source through participation in a proficiency testing  
150 program from a provider accredited to the ISO/IEC 17043 international standard.  
151

152 4.1.3. Where not available or not appropriate for the specific job function(s) being  
153 tested, tests may be obtained by an external source through participation in an  
154 interlaboratory comparison or developed internally by the FSP through  
155 participation in an interlaboratory comparison or intralaboratory comparison.  
156

### 157 4.2. Development

158  
159 4.2.1. Tests shall be developed to assess the performance of the FSP as it relates to all  
160 major job functions performed by the FSP. These areas may include but are not  
161 limited to the following:  
162

163 4.2.1.1. Detection of friction ridge impressions through optical, physical, and  
164 chemical processing / development techniques.  
165

166 4.2.1.2. Preservation of friction ridge impressions through photography and/or  
167 digital capture.  
168

169 4.2.1.3. Enhancement of friction ridge impression through digital processing.  
170

171 4.2.1.4. Recording exemplar impressions.  
172

173 4.2.1.5. Examination (Analysis, Comparison, and Evaluation) of friction ridge  
174 impressions, including scenarios involving:  
175

176 4.2.1.5.1. Potential donor sources paired arbitrarily  
177

178 4.2.1.5.2. Potential donor sources paired as a result of their similarity to one  
179 another, such as being derived from the result of an Automated

180 Biometric Identification System search of the unknown  
181 impression.

182  
183 4.2.1.6. Encoding, searching, and retrieving friction ridge impressions using ABIS.  
184

185 4.2.2. The extent to which the test sample is representative of casework shall be  
186 documented as it relates to the types, qualities, and conditions of the test  
187 specimens for the job functions being tested. Methods used to measure and assess  
188 the representativeness of the test sample to casework shall be documented and can  
189 range from subjective assessment by expert(s) to more objective approaches such  
190 as expert consensus panels or automated software. Statistical analyses  
191 appropriate for the type of data generated from the measurements should be used  
192 to demonstrate the extent to which the test sample compares to casework.  
193

194 NOTE 1: The OSAC Friction Ridge Subcommittee Proposed Best Practice  
195 Recommendations for Analysis and Comparison & Evaluation provide  
196 recommendations related to categorizing the quality of friction ridge  
197 detail/features, complexity (of an Impression), and complexity (of a Comparison)  
198 through observation.  
199

200 NOTE 2: Objective methods, such as automated software (where appropriate) or  
201 expert consensus panels, are more robust than subjective methods for assessing  
202 representativeness of test samples to casework.  
203

204 4.2.3. Test samples should include a variety of different substrate types (e.g., porous,  
205 non-porous, semi-porous), friction ridge development techniques (e.g., optical,  
206 chemical, and physical processes), and deposition matrices (e.g. sweat, oils,  
207 blood, livescan, ink, etc.).  
208

209 4.2.4. Test samples should include specimens which assess the full range of association  
210 and non-association source conclusions that can be encountered in casework. At  
211 a minimum, tests shall include specimens which assess source conclusions  
212 representing the strongest support for same sources (e.g., source identification),  
213 the strongest support for different sources (e.g., source exclusion), and insufficient  
214 support for a stronger source conclusion (e.g., inconclusive).  
215

216 NOTE: The OSAC Friction Ridge Subcommittee Proposed Standard for Friction  
217 Ridge Examination Conclusions provides qualitative expressions for the range of  
218 conclusions that may be reached following friction ridge comparisons.  
219

220 4.2.5. Test samples should only include impressions for which the ground truth state is  
221 known.  
222

223 NOTE: Knowledge of ground truth is more robust and enables performance to be  
224 measured in terms of both accuracy and consistency. Ground truth is essential for  
225 measuring accuracy; however, ground truth is not necessary for measuring

226 consistency between participants through participation in proficiency testing  
227 programs or other interlaboratory comparisons or intralaboratory comparisons. In  
228 circumstances where it is impractical to create suitable test specimens for which  
229 ground truth is known, casework samples can be used to assess performance in  
230 terms of consistency and agreement with assigned values.  
231

- 232 4.2.6. Test specimens shall each have an assigned value for which participant results are  
233 expected to conform and performance is evaluated. Criteria for determining the  
234 assigned values shall be documented, appropriate for the performance  
235 characteristic being measured (e.g., accuracy and/or consistency), and based on  
236 observable or measurable attributes of the test specimens (e.g., quality and  
237 quantity of friction ridge detail/features). Where applicable to the job function  
238 being tested (e.g., examination of friction ridge impressions), the observable or  
239 measurable attributes of the test specimen to support a source conclusion should  
240 conform to those criteria established by a national standard or consensus body  
241 recognized by the OSAC Friction Ridge Subcommittee.  
242

243 NOTE: Knowledge of ground truth for test specimen is not always sufficient for  
244 determining the assigned value. For tests designed to assess performance related  
245 to examination of friction ridge impressions, test specimens might be known to  
246 have come from same (or different) sources but lack sufficient observable or  
247 measurable attributes to support a strong source conclusion (e.g., source  
248 identification or source exclusion). In these circumstances, a response choice  
249 indicating insufficient support for a stronger source conclusion (e.g.,  
250 inconclusive) can be the assigned value.  
251

- 252 4.2.7. Neither the ground truth nor assigned values for test specimens shall be disclosed  
253 to the participants to which the test is administered until after the test is  
254 completed.  
255

### 256 4.3. Validation 257

- 258 4.3.1. Tests shall be validated prior to administration to participants.  
259

260 4.3.1.1. Tests obtained from external sources should include a description of how  
261 the tests were developed and validated in accordance with the  
262 requirements specified in sections 4.2 and 4.3 of this standard, to allow the  
263 FSP to verify conformance to this standard and serve as evidence of  
264 conformity. Documentation of the validation completed by the external  
265 provider can serve as evidence of conformity.  
266

267 4.3.1.2. Tests developed by the FSP or tests obtained from external sources that do  
268 not include a description of how the tests were developed and validated in  
269 accordance with the requirements specified in sections 4.2 and 4.3 of this  
270 standard shall be validated by the FSP to verify conformance to this

271 standard. Documentation of the validation completed by the FSP can  
272 serve as evidence of conformity.

273  
274 4.3.2. Test validation shall include the following:

275  
276 4.3.2.1. Verification that test samples are representative of those encountered in  
277 casework as it relates to the types, qualities, and conditions of the test  
278 specimens for the job functions being tested.

279  
280 4.3.2.2. Verification that the test can be completed using the materials included in  
281 the test by pre-distribution administration of the test to participants  
282 independent of the test development and in the same conditions as the  
283 proposed test.

284  
285 NOTE: For tests developed or validated by the FSP, the personnel  
286 participating in the pre-distribution administration of the test can be  
287 internal or external to the FSP.

288  
289 4.3.2.3. Verification that the pre-distribution test results correspond to the assigned  
290 values.

291  
292 4.3.3. The results of the validation demonstrating that the test conforms to the  
293 requirements set forth by this standard shall be documented and maintained by the  
294 FSP.

295  
296 4.4. Administration

297  
298 4.4.1. The FSP shall be responsible for ensuring the test has been validated prior to  
299 distribution. Documentation verifying the test has been developed and validated  
300 in accordance with the requirements specified in sections 4.2 and 4.3 of this  
301 standard shall be obtained or produced by the FSP prior to test administration.  
302 This applies to tests developed internally or obtained from external sources.

303  
304 4.4.2. All FSP personnel shall complete at least one proficiency test, interlaboratory  
305 comparison, or intralaboratory comparison annually.

306  
307 4.4.3. Tests shall only be administered to FSP personnel approved to perform  
308 independent casework.

309  
310 4.4.4. Tests shall be administered in conditions reflecting casework (e.g., environmental  
311 conditions, equipment, time constraints, etc.) and in accordance with applicable  
312 FSP policies and procedures. Supporting task relevant contextual information  
313 may be provided to participants, provided that the contextual information does not  
314 exceed that to which the participants are exposed to in normal casework.

315

316 4.4.5. Tests shall be administered such that the results produced by individual FSP  
317 personnel are their own and not influenced by other participants, such as through  
318 Consultation, prior to Verification or Technical Review.  
319

320 NOTE: This does not preclude participants from using tools or equipment  
321 (including automated comparison software or statistical models) that are  
322 otherwise available and permissible for use in normal casework.  
323

324 4.4.6. Tests should be administered such that participants are not exposed to subtle cues  
325 that may hint at or guide them to the expected results without direct examination  
326 of the test specimen.  
327

328 NOTE: Subtle cues can be unintentionally introduced or inferred by the design or  
329 administration of a single test or patterns that emerge from a sequence of tests  
330 (e.g., see OSAC Technical Series 004: Human Factors in Validation and  
331 Performance Testing of Forensic Science --  
332 <https://doi.org/10.29325/OSAC.TS.0004>).  
333

334 4.4.7. Tests can be administered in one of two formats:  
335

336 4.4.7.1. Non-blind testing: Participants are aware they are being tested  
337

338 4.4.7.2. Blind testing: Participants are not aware they are being tested  
339

340 NOTE: Blind testing is more robust than non-blind testing.  
341

342 4.5. Evaluation  
343

344 4.5.1. The FSP shall have established criteria for evaluating acceptable performance as  
345 it relates to both the individual FSP personnel *and* overall FSP quality system.  
346 Methods used to evaluate performance shall be documented and include statistical  
347 analyses appropriate for the evaluation. These criteria and methods shall be  
348 documented prior to test administration and address:  
349

350 4.5.1.1. Agreement of participant results to the assigned values.  
351

352 4.5.1.2. Sufficient documentation of observed data to support the participant's  
353 results.  
354

355 4.5.1.3. Completion of the test in accordance with applicable FSP policies and  
356 procedures.  
357

358 NOTE 1: Acceptable performance can allow for deviations from the  
359 assigned values provided the extent of allowable deviations are  
360 documented prior to test administration and bounded within the range of

361 acceptable results that are normally permissible under casework  
362 conditions.

363  
364 NOTE 2: Performance of individual FSP personnel is evaluated based on  
365 the results produced *prior* to the application of quality controls involving  
366 influence by other participants, such as Verification or Technical Review.  
367 Performance of the overall FSP quality system is evaluated based on the  
368 results produced *after* the application of quality controls involving  
369 influence by other participants, such as Verification or Technical Review.  
370

371 4.5.2. Cause analysis shall be performed when a result is generated during the test that  
372 does not correspond to the assigned value or exceeds the range of acceptable  
373 results. Corrective actions shall be taken where appropriate.  
374

375 NOTE: Cause analysis can include consideration of factors related to the  
376 environment, facilities, equipment, examination method, policies and procedures,  
377 training, and skills or abilities of the FSP personnel.  
378

379 4.6. Documentation  
380

381 4.6.1. The FSP shall have a procedure to maintain records documenting the following as  
382 it relates to the selection, development, validation, and administration of the test,  
383 as well as evaluation of the results in accordance with the requirements and  
384 recommendations set forth in sections 4.2 through 4.5 of this standard:  
385

386 4.6.1.1. The identity of the Proficiency Testing Program Manager responsible for  
387 the selection, administration, and evaluation of tests within the FSP  
388

389 NOTE: The proficiency testing program manager can be a Quality  
390 Assurance Manager, Supervisor, or otherwise designated FSP personnel.  
391

392 4.6.1.2. The source of the test (for tests obtained from external sources) or identity  
393 of the personnel responsible for developing the test along with their  
394 qualifications (for tests developed internally).  
395

396 4.6.1.3. The job function(s) tested.  
397

398 4.6.1.4. Verification that the test has been developed and validated in accordance  
399 with the requirements set forth in sections 4.2 and 4.3 of this standard.  
400

401 4.6.1.5. A description of the types of substrates included in the development of the  
402 test.  
403

404 4.6.1.6. A description of the development techniques included in the development  
405 of the test.  
406

- 407 4.6.1.7. A description of the deposition matrices of the test samples included in the  
408 development of the test.  
409
- 410 4.6.1.8. A description of the scenario(s) presented in the test, including any  
411 supplemental background or contextual information.  
412
- 413 4.6.1.9. Criteria for determining the assigned values for test specimen.  
414
- 415 4.6.1.10. A list of the qualifications of the personnel participating in the pre-  
416 distribution administration of the test.  
417
- 418 4.6.1.11. A list of the FSP personnel to which the test was administered.  
419
- 420 4.6.1.12. The date the test was administered to participant(s) and the date the test  
421 was completed by the participant(s).  
422
- 423 4.6.1.13. Conditions under which the test was administered to the participants.  
424
- 425 4.6.1.14. Format of the test administered to the participants (non-blind or blind).  
426
- 427 4.6.1.15. Participant responses.  
428
- 429 4.6.1.16. Criteria for acceptable performance as it relates to:  
430
- 431 4.6.1.16.1. Individual FSP personnel  
432
