

# Development of an Intelligent Monitoring System for the Cold Neutron Source Cryogenics System

Zoë Masters

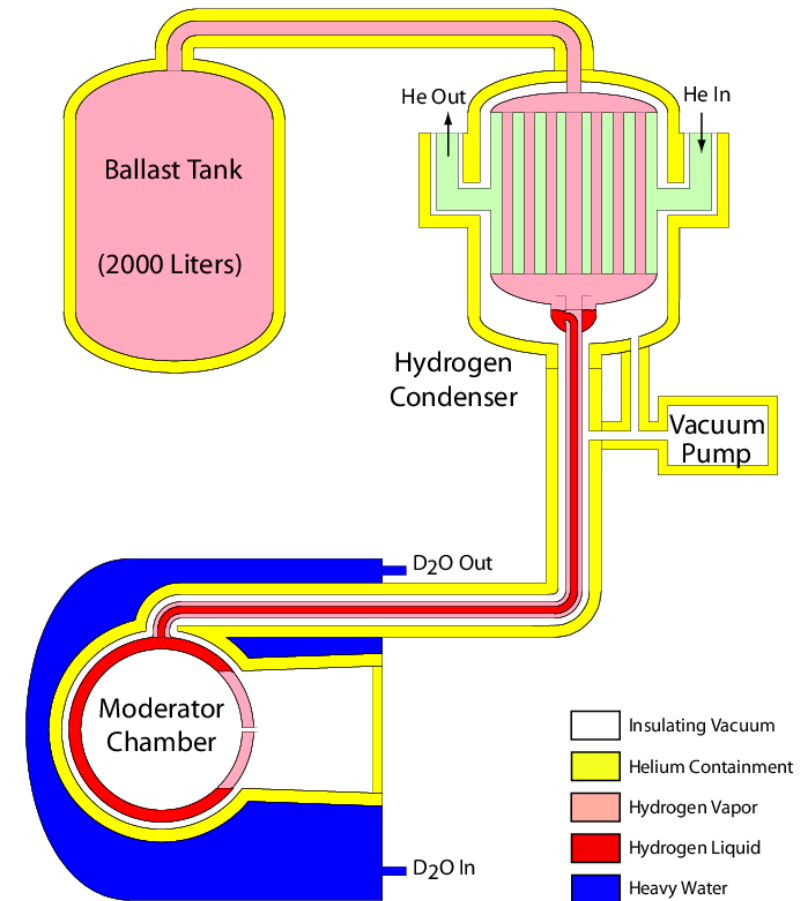

Mentor: Robert Newby

August 15<sup>th</sup>, 2024

- Cold Source Background
- Project Overview
- Decision Trees
- Current State
- Conclusion

- What is a cold source?
  - Slows down neutrons for use in experiments using a moderator
  - System is made up of multiple components spread throughout the facility
  - Current system was installed in 2002 and updates have continued to make it more automated

## Liquid Hydrogen Thermosiphon

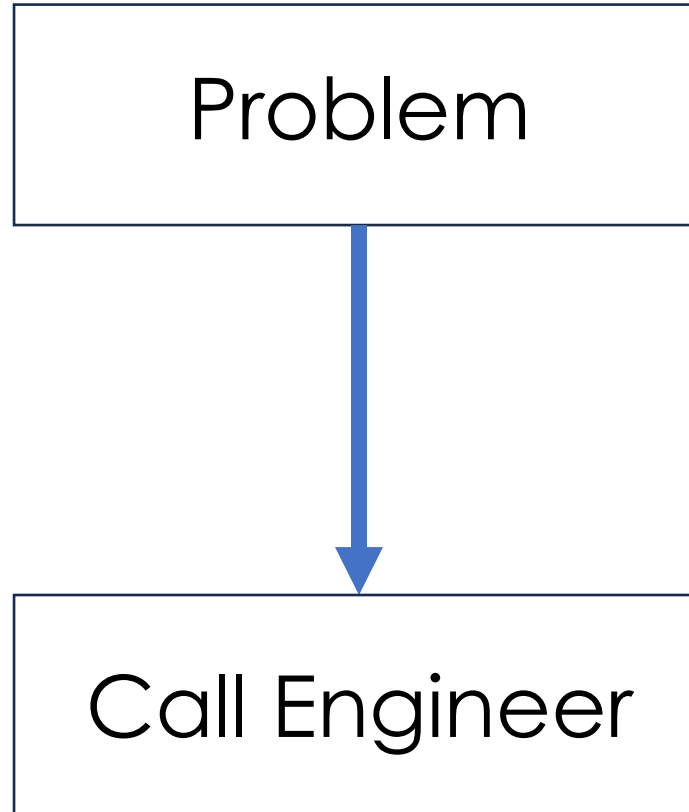

- Goal was to create a graphical user interface (GUI) application that can guide operators through an alarm
- Giving a guide so a non-technical person can identify and start to isolate cause of the alarm
  - This will minimize calling the engineer right away to fix the problem and improve efficiency

- What happens when something goes wrong with the system?
  - There is a 20-minute window to rectify the issue
  - If problem isn't solved, minimum downtime is 48 hours
  - Some issues require getting to the physical location of the equipment to fix
  - Panic?
- Less downtime means more science and engineering

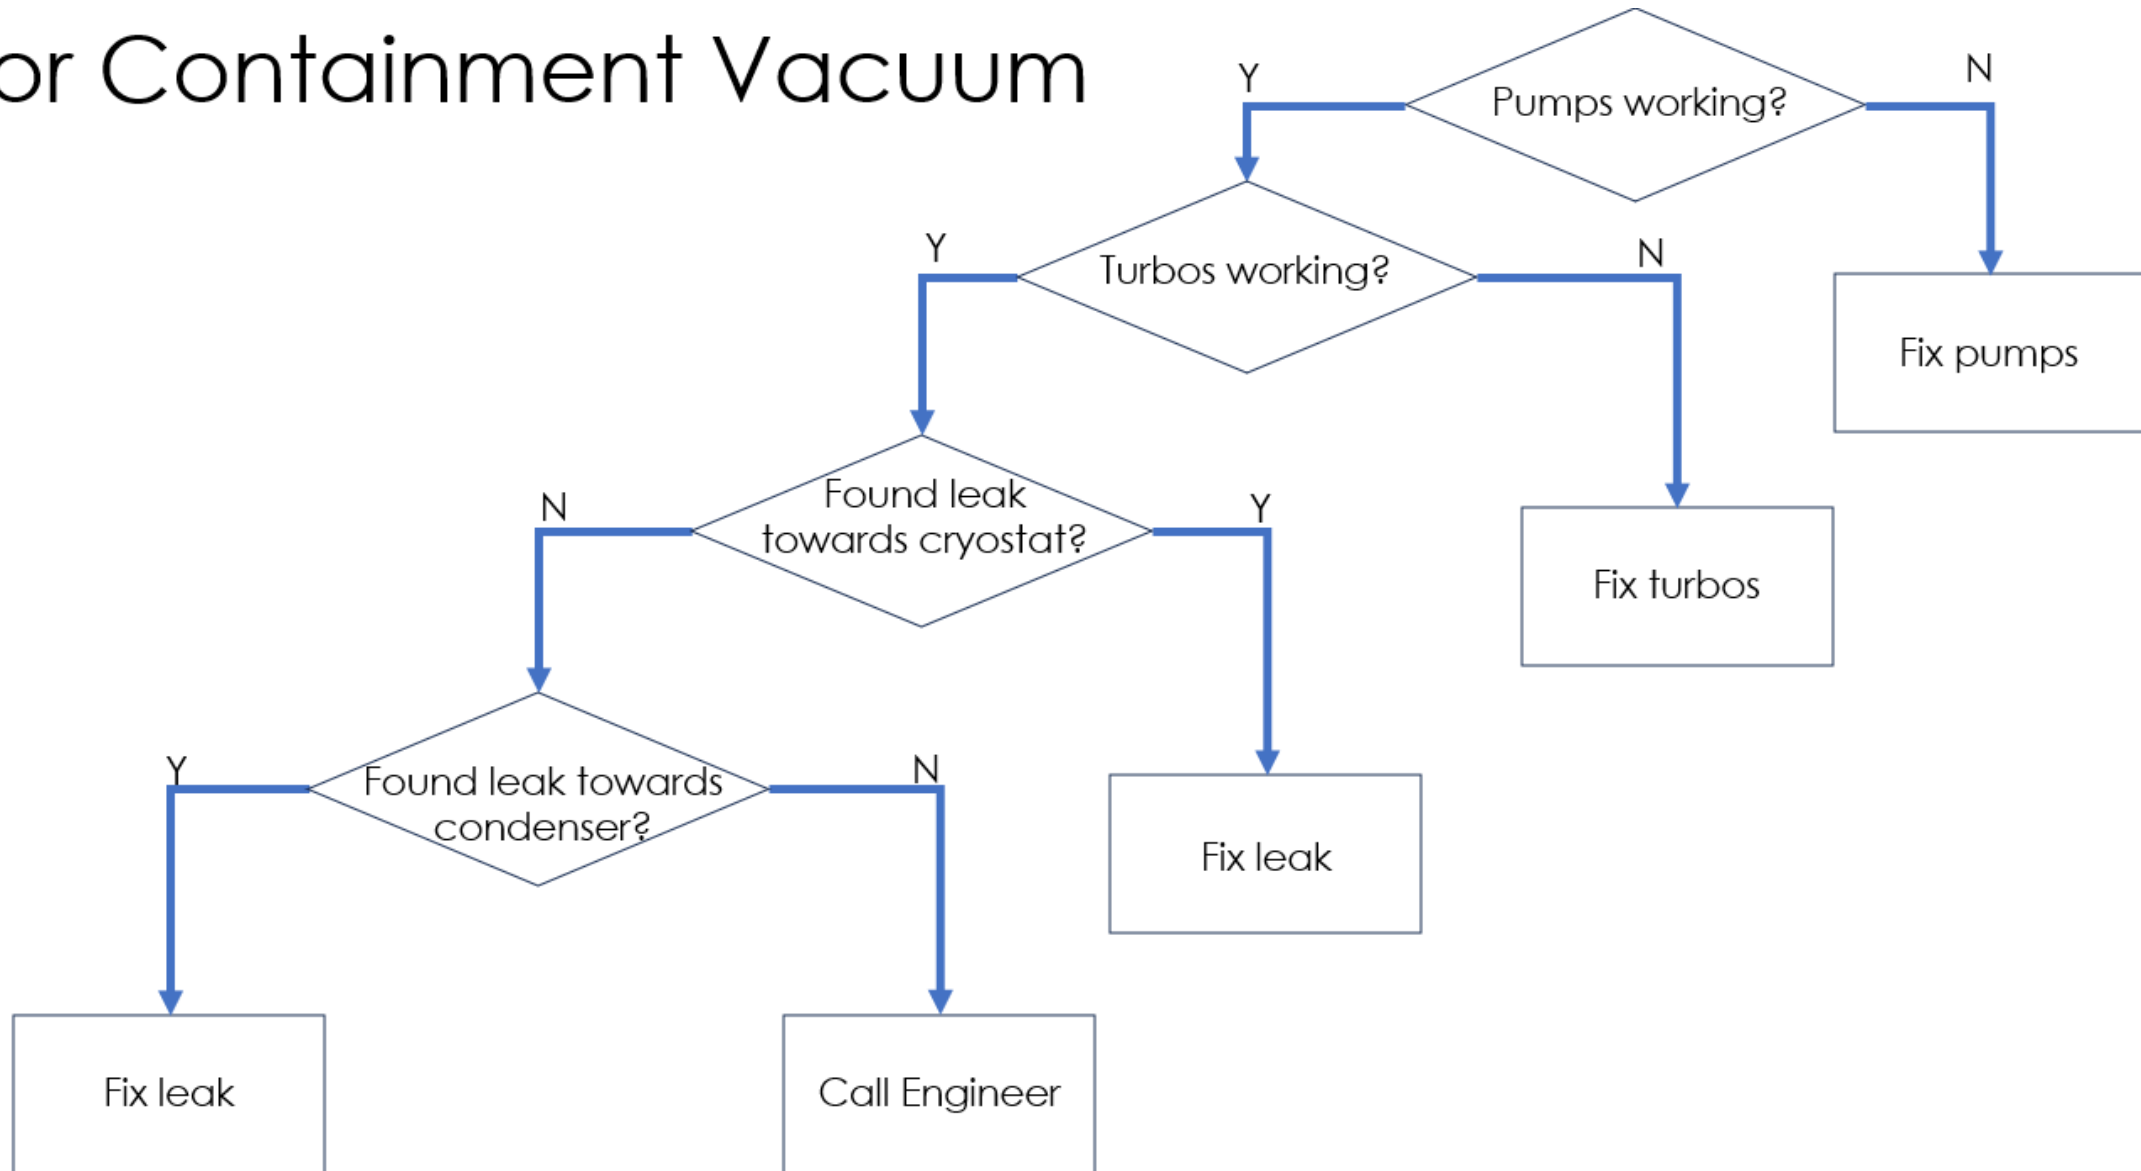

- Started with learning about how the components of the systems work together
- Didn't want to create something that needs another set of directions and further complicate things
- Needs to be clear, concise, and intuitive
- Using Python as there are programs already written and it doesn't require third party software

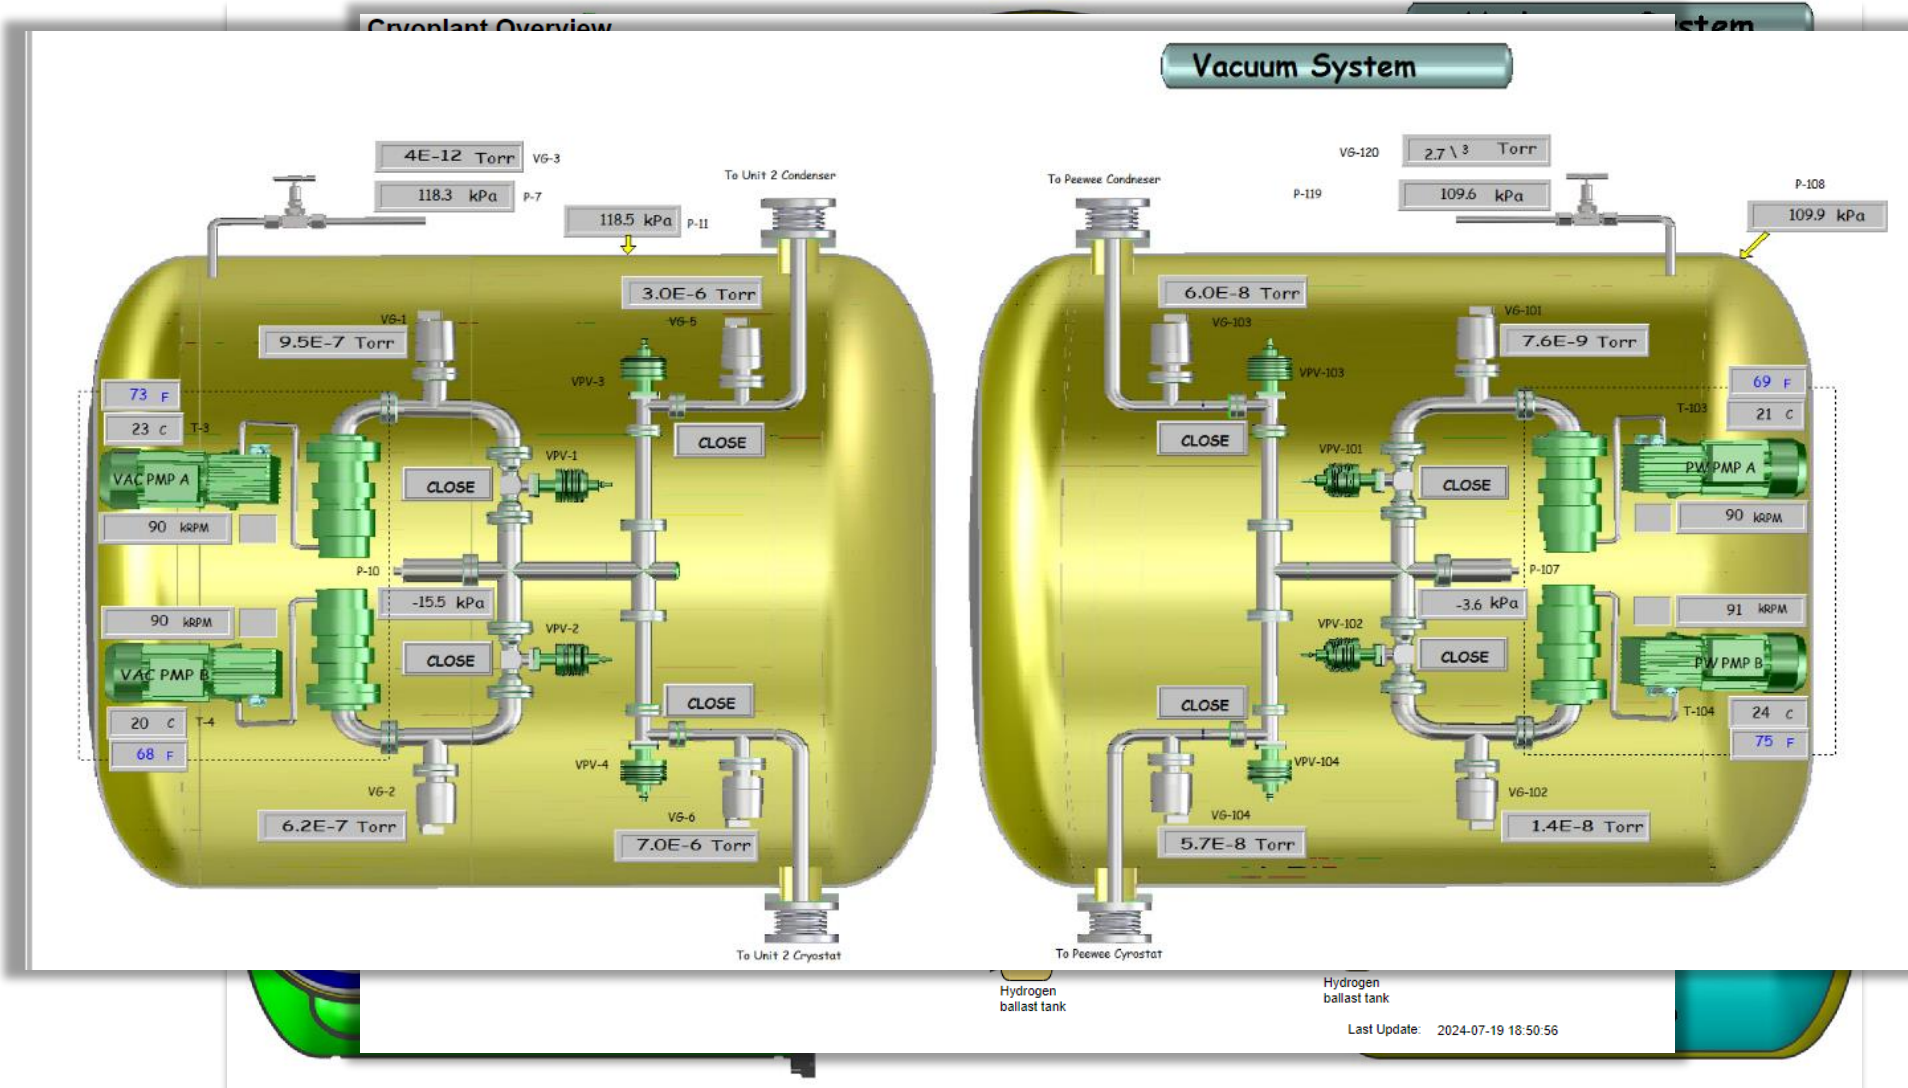

# Decision Trees

## Poor Containment Vacuum

# First Iteration

Radio Button Example

Are the pumps operating?	Are the turbos operating?	Are valves in correct positions?	Locating a leak (Instructions below) - If vacuum improve while isolating sections there is not a leak in that section and continue on.	Exhausted all options?
<input type="radio"/> Yes <input type="radio"/> No	<input type="radio"/> Yes <input type="radio"/> No	<input type="radio"/> Yes <input type="radio"/> No	<input type="radio"/> 1.) Working towards cryostat <input type="radio"/> 2.) Working towards condenser	<input type="radio"/> Yes
Next steps:	Next steps:	Next steps:	Next steps:	Next steps:

# Current Form

MainWindow

Poor Insulating Vacuum

3.) Check for leak towards cryostat. If vacuum improves leak is not in that section.

Directions: Close VPV-2 and observe vacuum.If no issues, reopen and then close VPV-4 and observe vacuum. (Can check state of valves under VPV2\_OPEN and VPV4\_OPEN)

Finished this section without finding leak?

Yes No

VPV2\_OPEN

VPV2\_OPEN  
Time: 2024-07-08 11:31:49.493000  
Recorded value: 1

Directions: Close VPV-2 and observe vacuum. If no issues, reopen and then close VPV-4 and observe vacuum. (Can check state of valves under VPV2\_OPEN and VPV4\_OPEN)

Finished this section without finding leak?

Yes No

Leak located, take steps to fix

AOV\_161\_CLOSED

Stats:

<--Back

- 2 trees implemented in the code
  - Abnormal He Containment Pressure
  - Poor Containment Vacuum
- Code is structured and commented to easily add future trees to continue to expand the scope
- Was able to incorporate data from SQL database that pulls most recent sensor states

- **Future work includes:**
  - Creating more decision trees for other alarm scenarios
  - Testing in system and evaluate effectiveness
  
- **Acknowledgements:**
